Rock deformation

Relation strain V.S. stress

Elastic (Young modulus)

Plastic (~Viscosity)

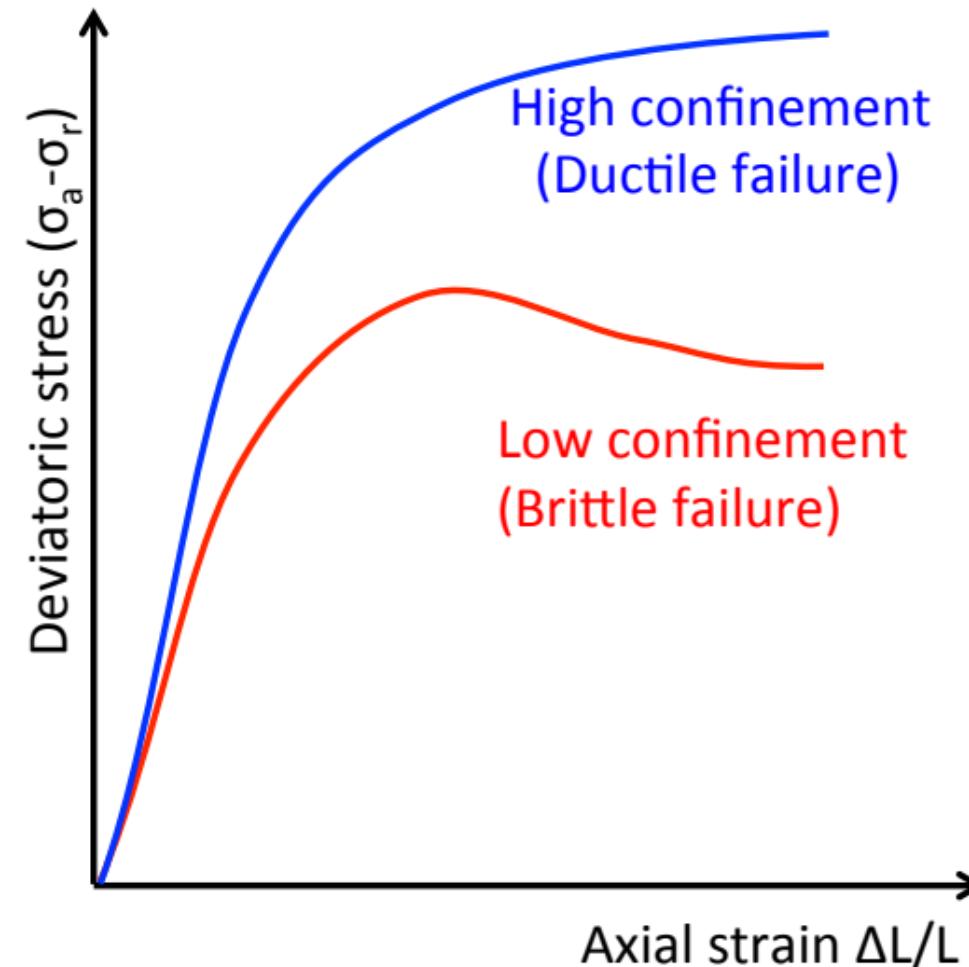

a. This is an undeformed cylinder of rock.

b. This cylinder was subjected to high confining pressure (uniform in all directions) and, at the same time, compression from above. It deformed in a ductile manner, becoming shorter and fatter.

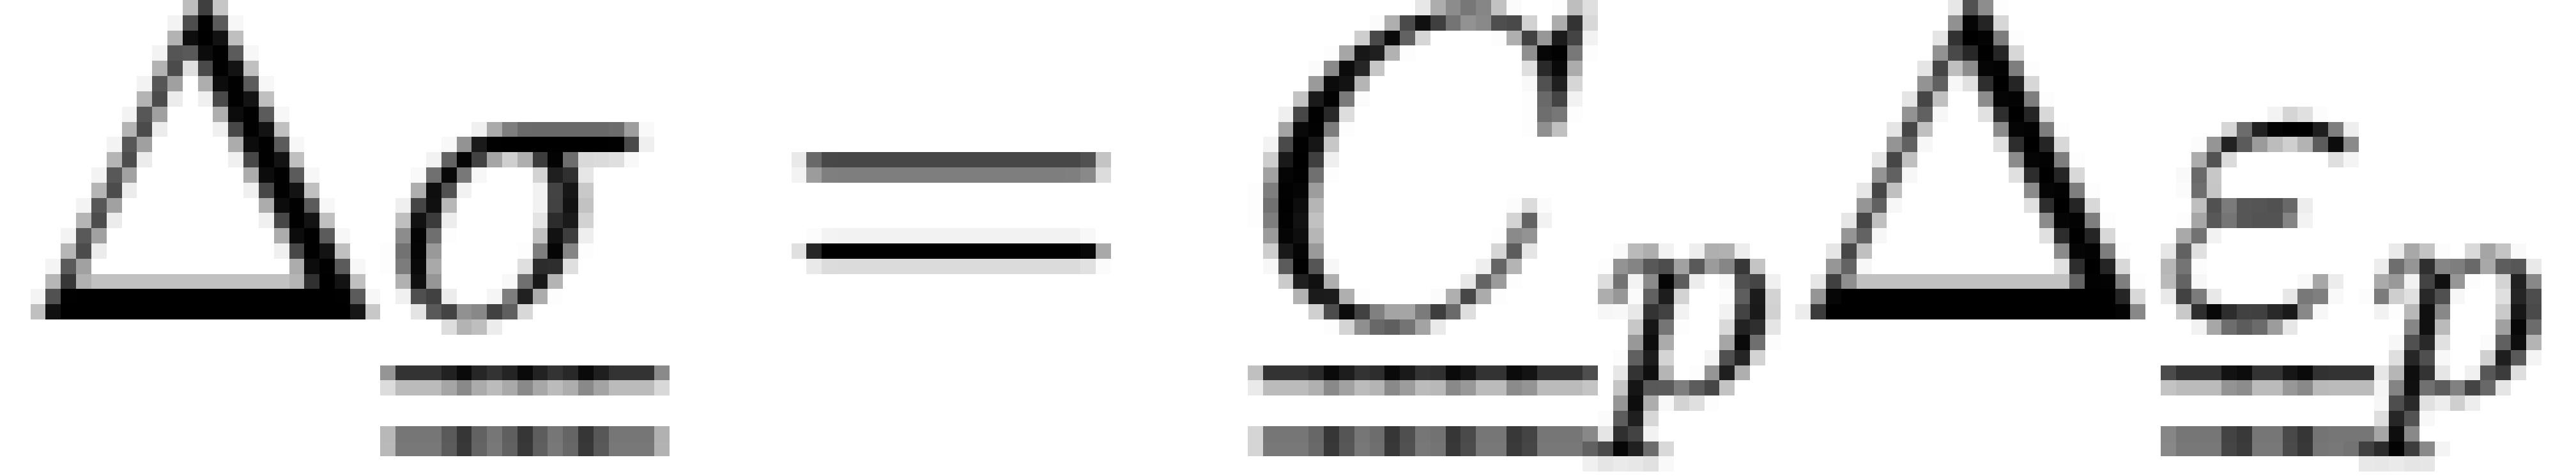

c. An identical cylinder was subjected to the same amount of compression from above, but this time with a lower confining pressure. It deformed in a brittle manner, with many large fractures.

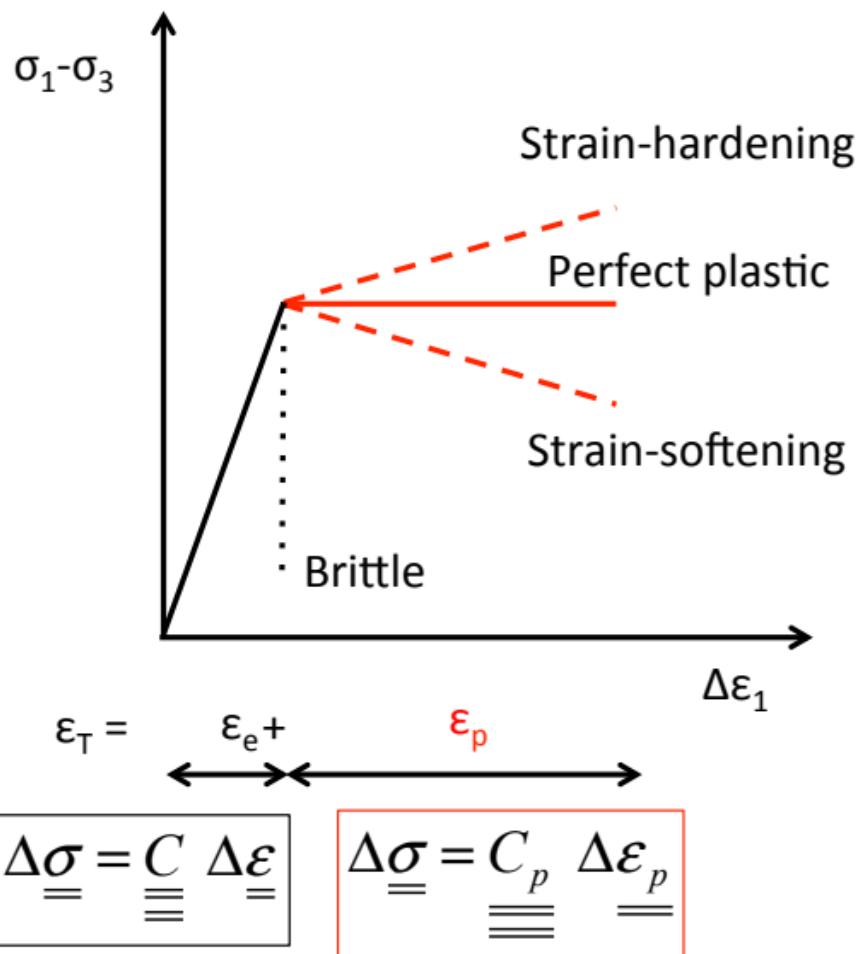

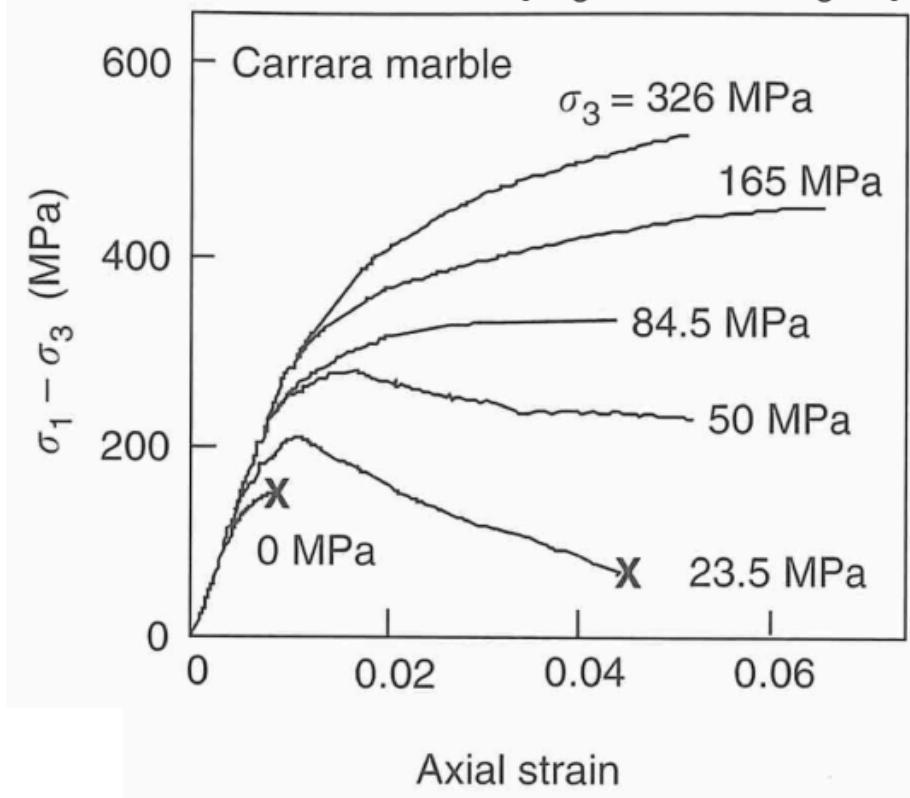

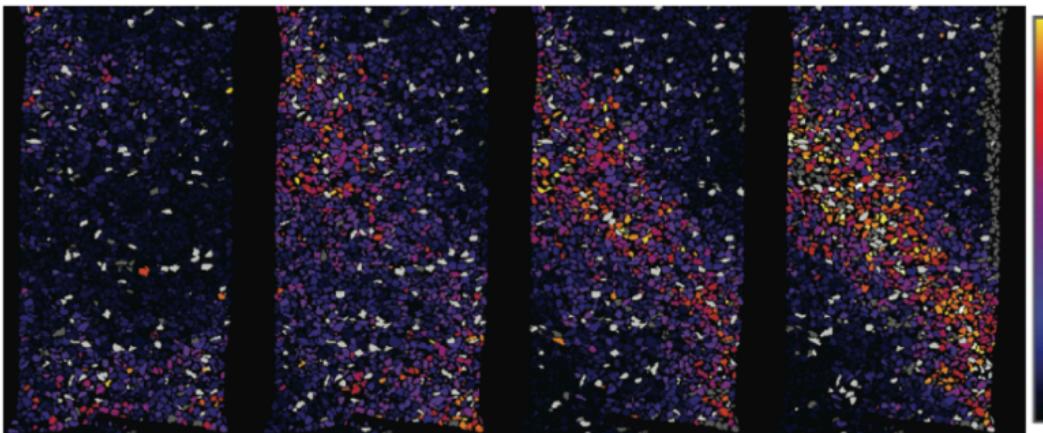

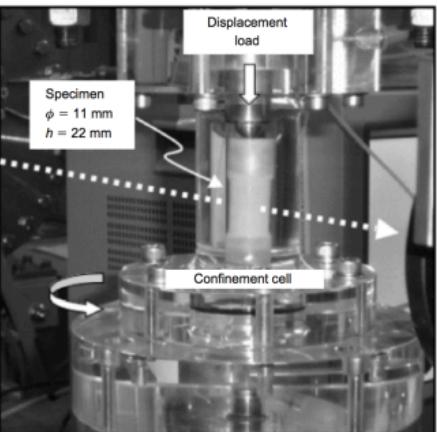

[Jaeger et al. 2007 – Fig. 4.5]

WORLD STRESS MAP

2009 - 2nd edition, based on the WSM database release 2008

Helmholtz Centre Potsdam - GFZ German Research Centre for Geosciences

Authors

Oliver Heidbach, Mark Tingay, Andreas Barth, John Reinecker, Daniel Kurfürst, and Birgit Müller

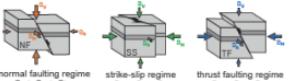

The stress maps display the maximum horizontal compressional stress S_H

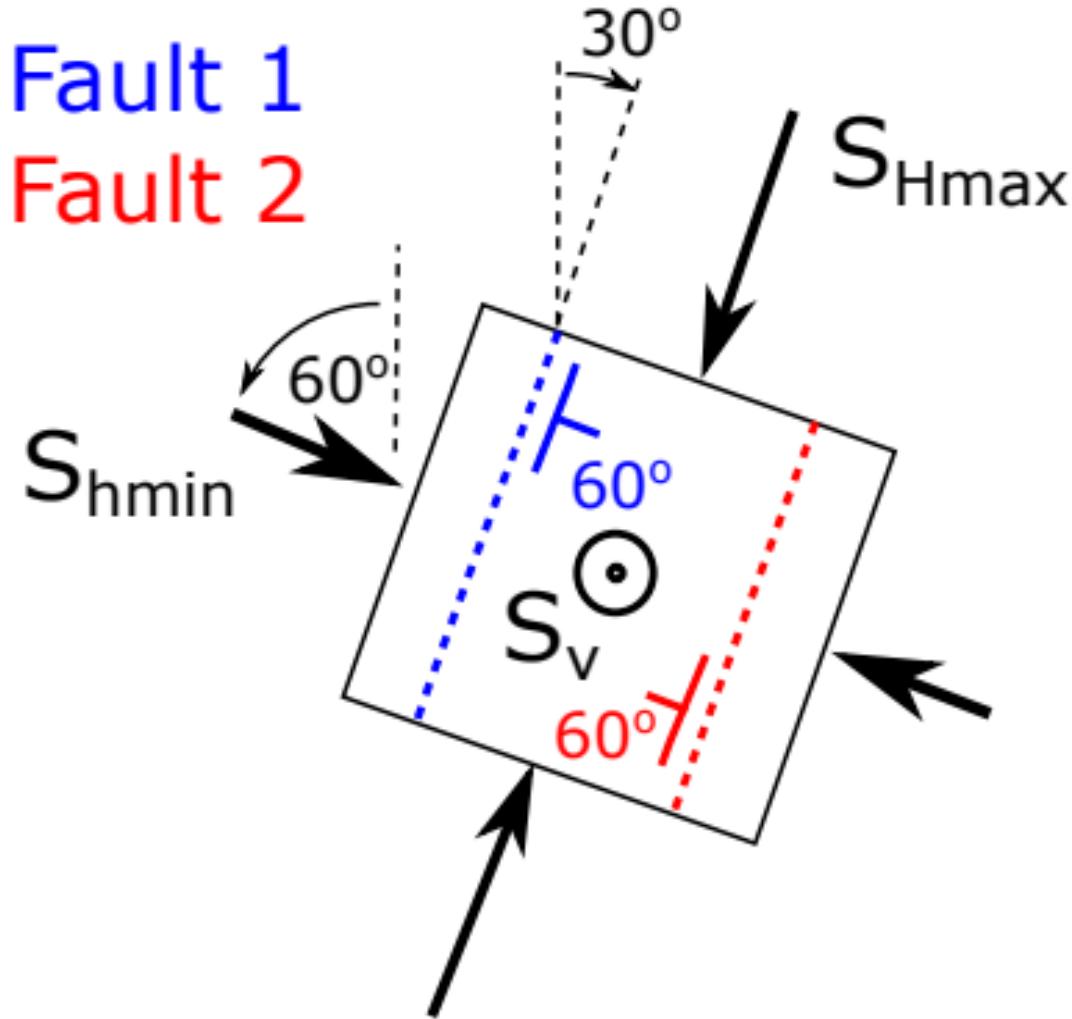

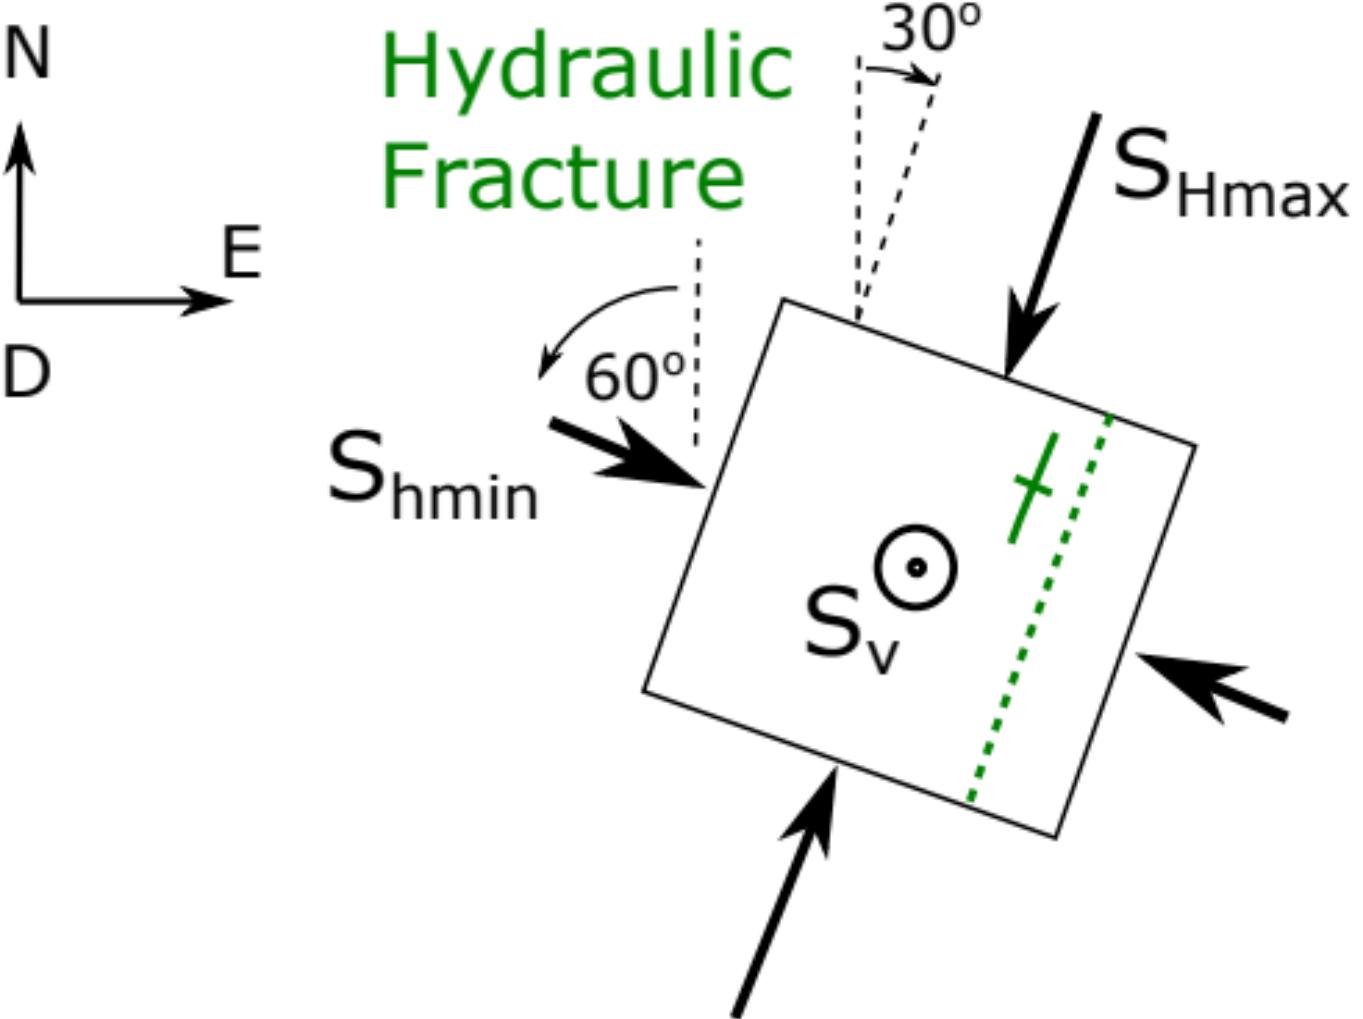

Method	Quality
focal mechanism	S_H is within $\pm 15^\circ$
breakouts	S_H is within $\pm 20^\circ$
drl. induced frac.	S_H is within $\pm 25^\circ$
overcoring	
hydro. fractures	
geol. indicators	

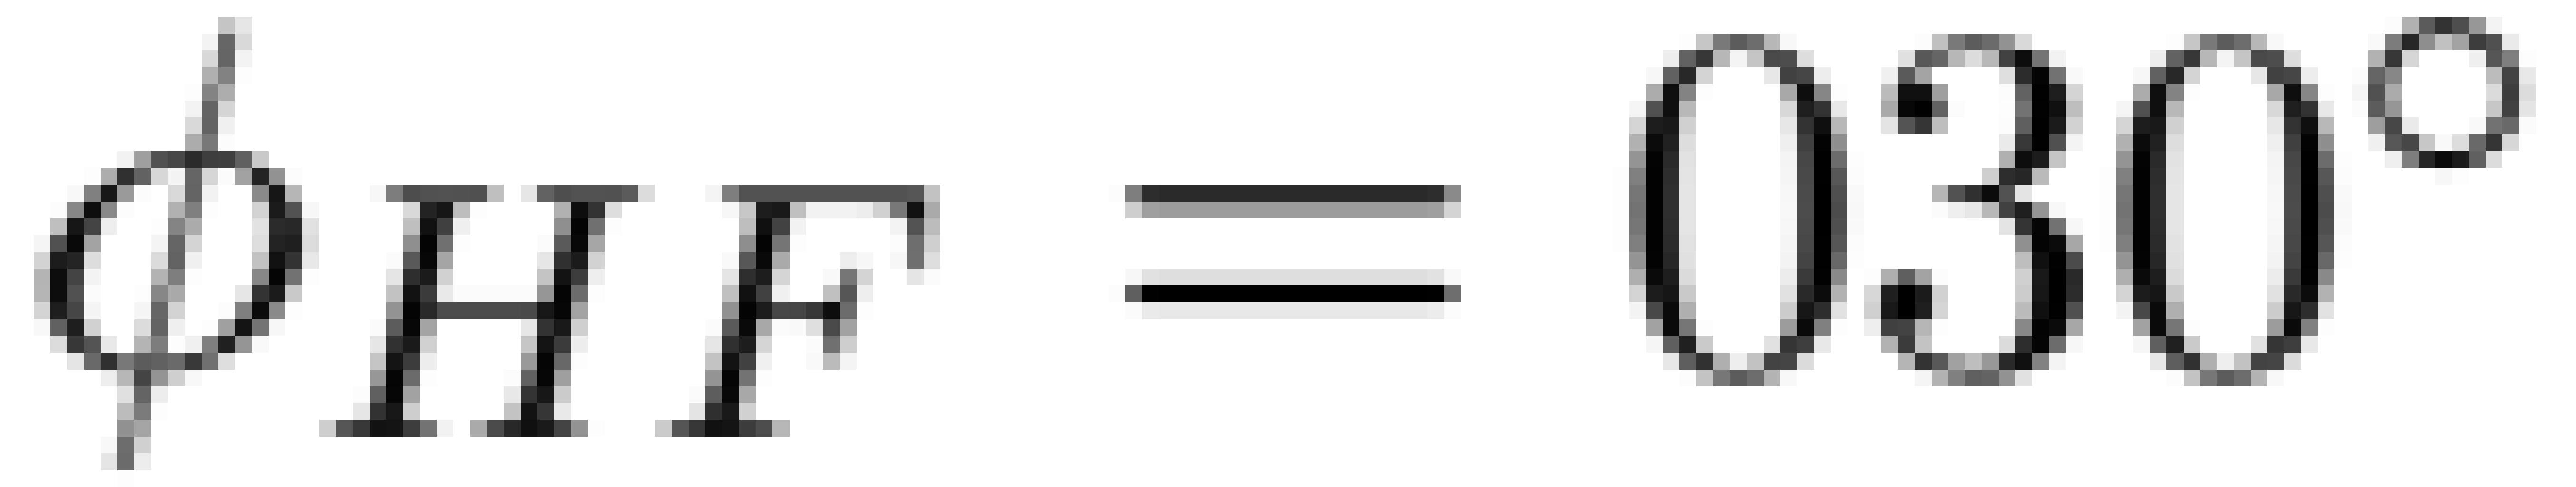

Data depth range

0-40 km

Stress Regime
Normal faulting
Strike-slip faulting
Thrust faulting
Unknown regime

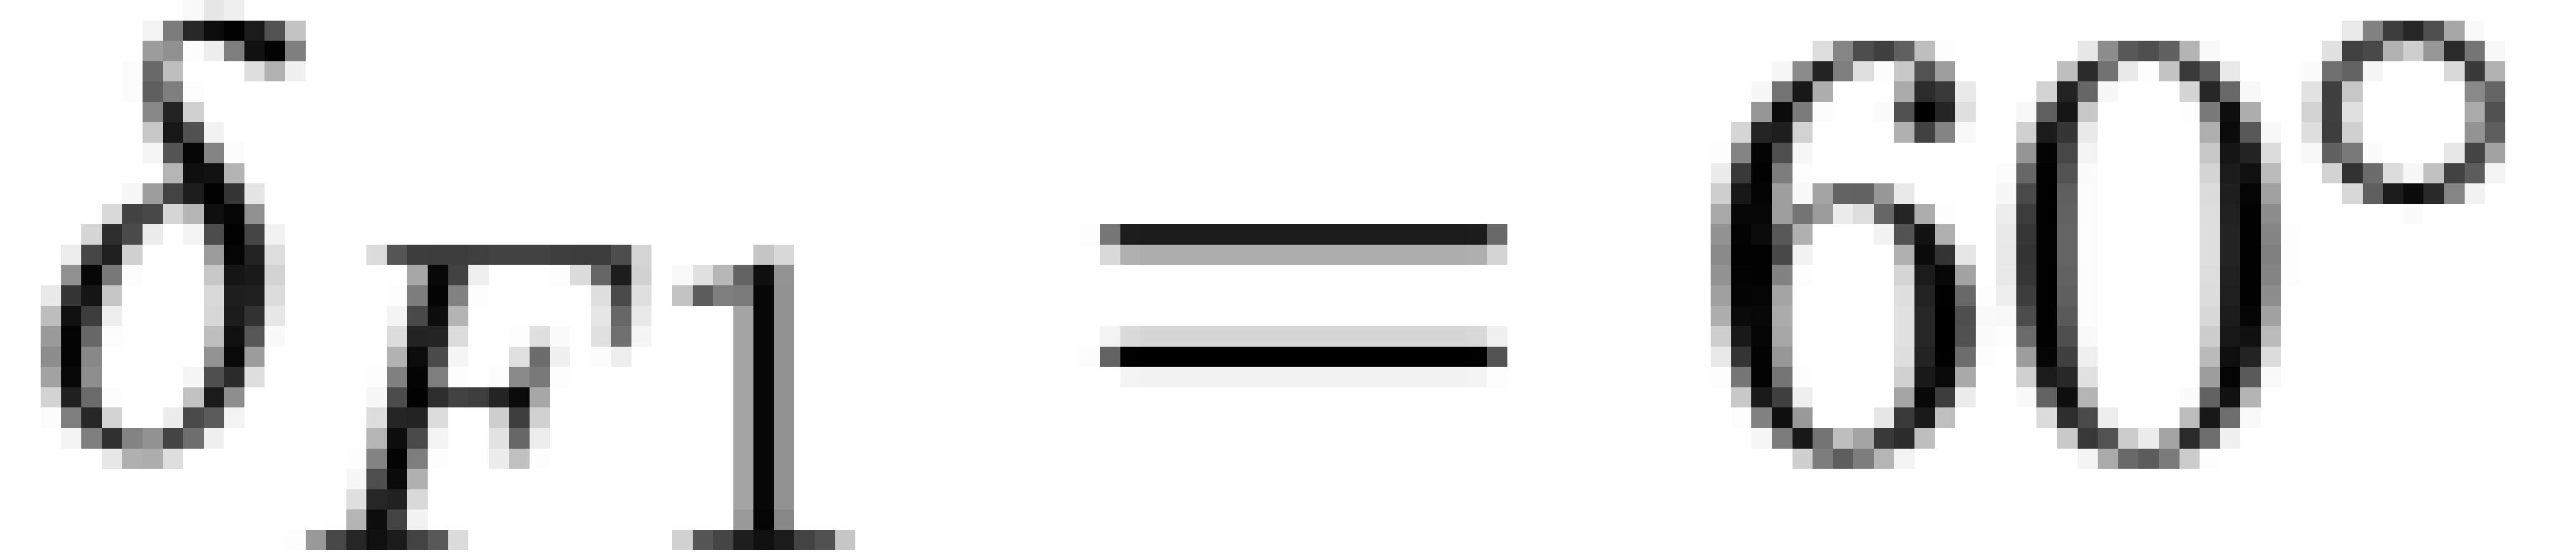

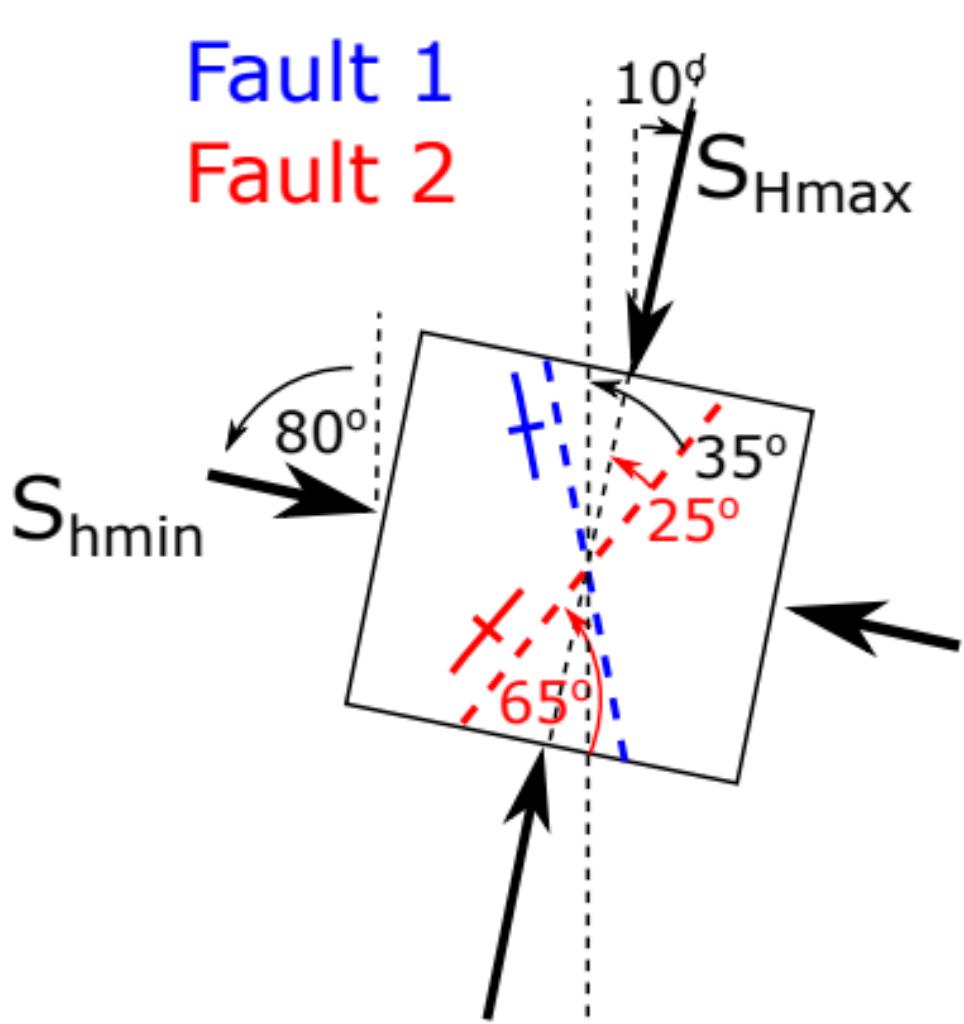

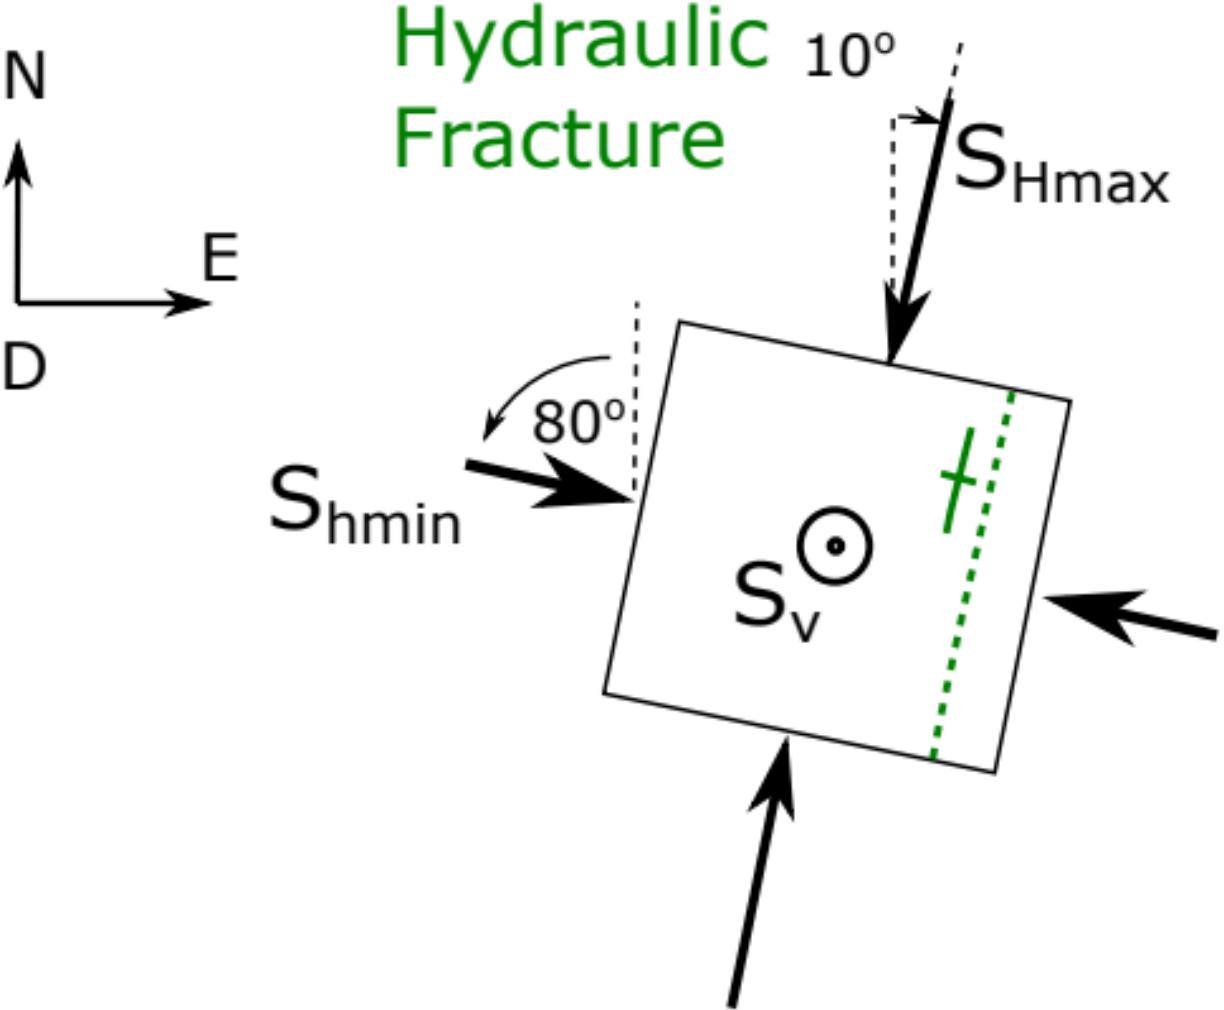

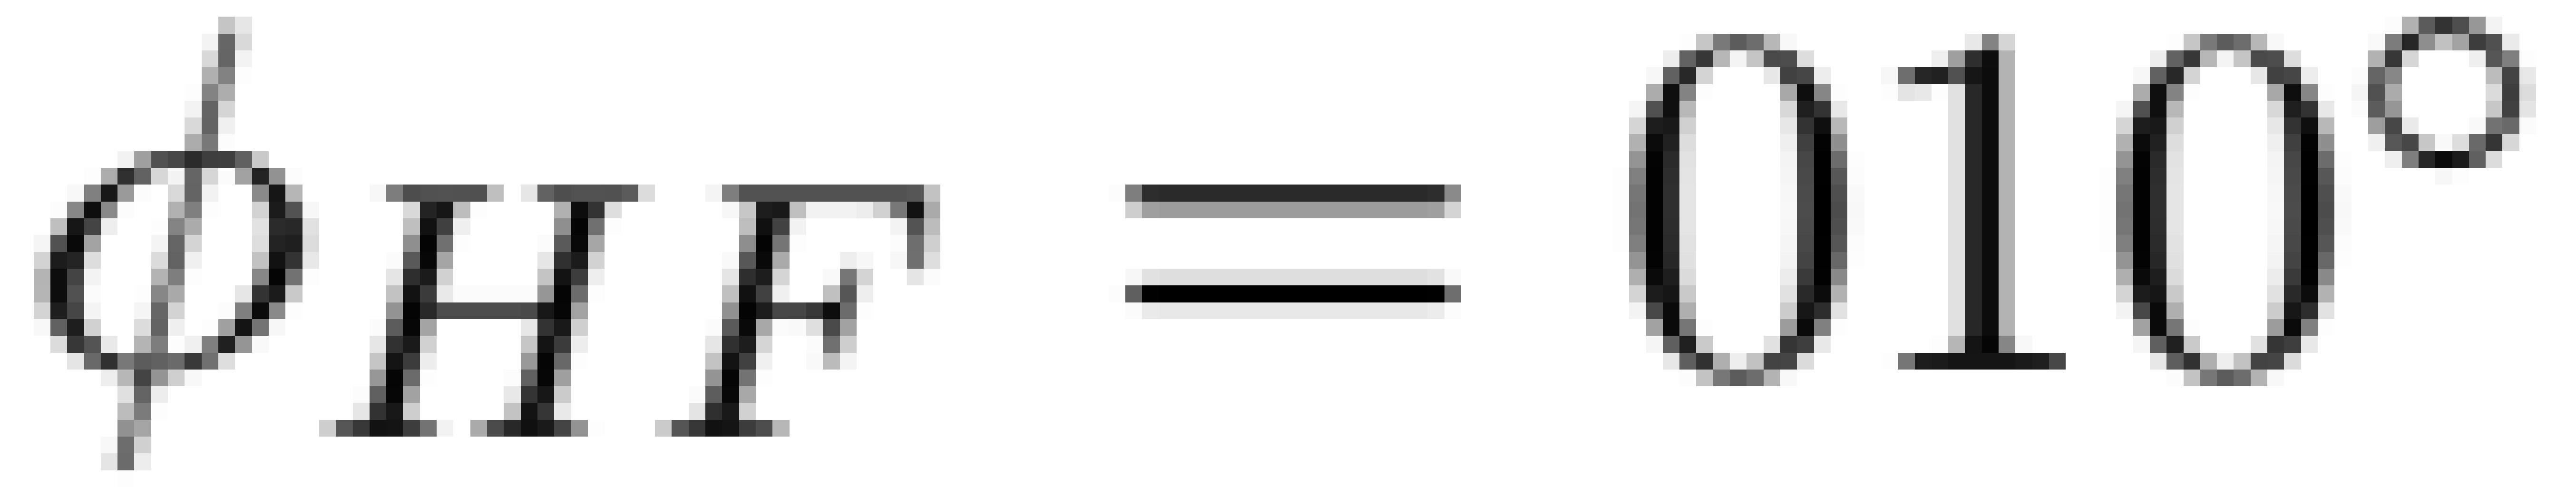

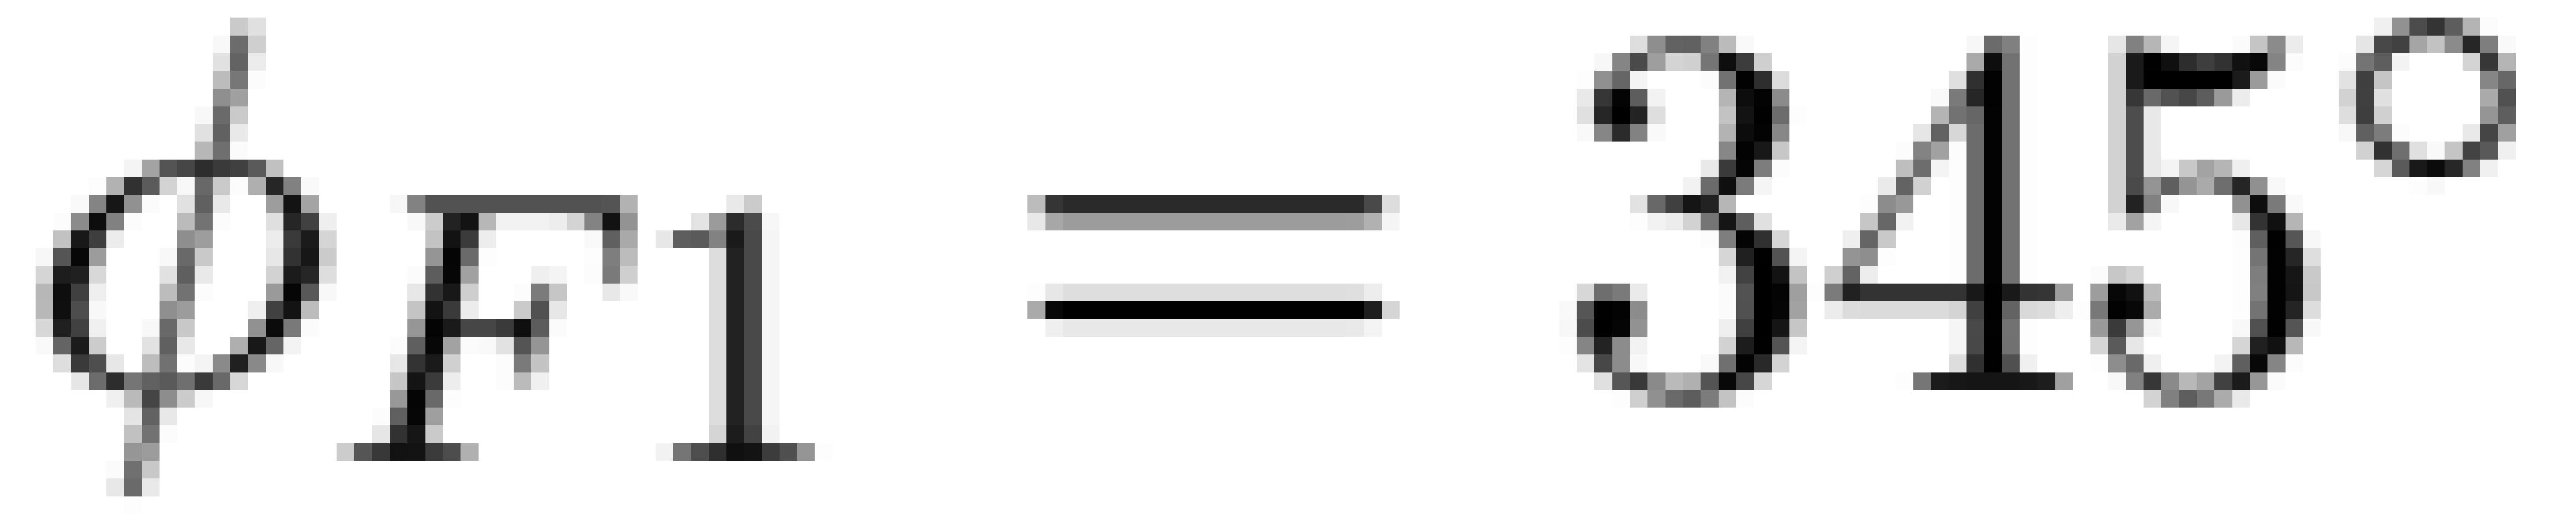

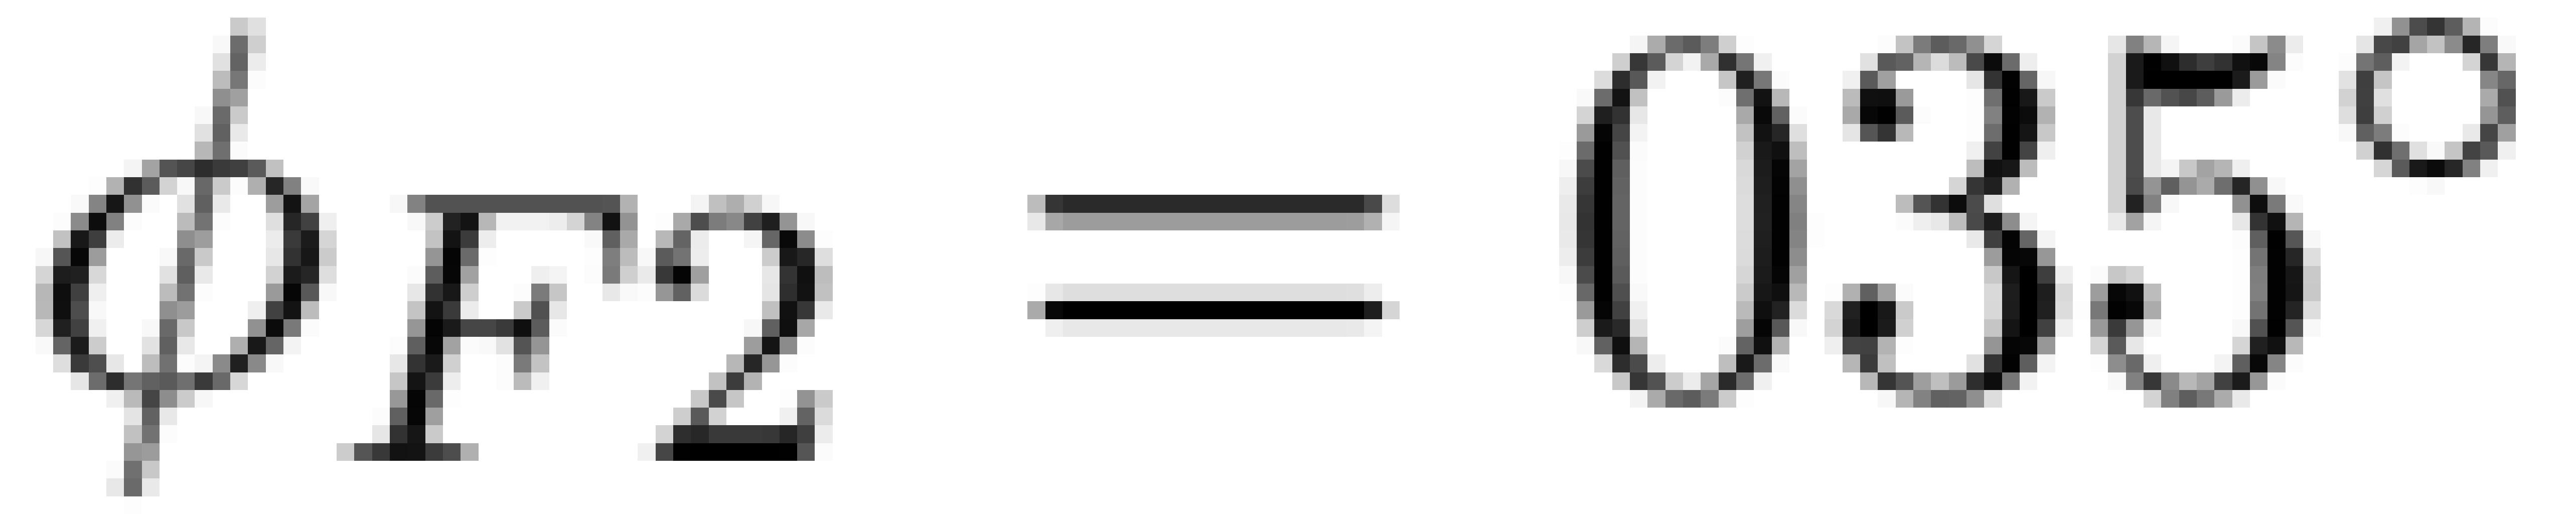

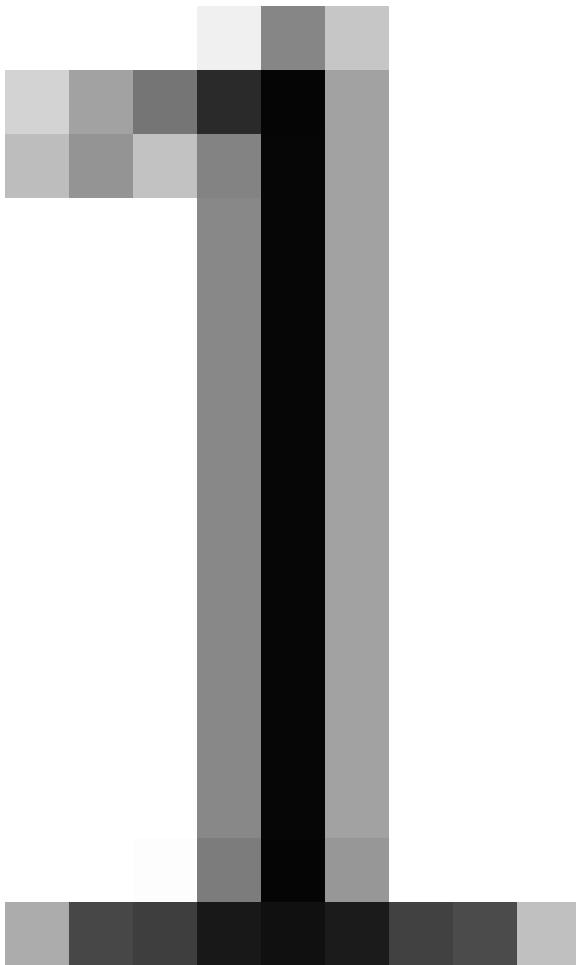

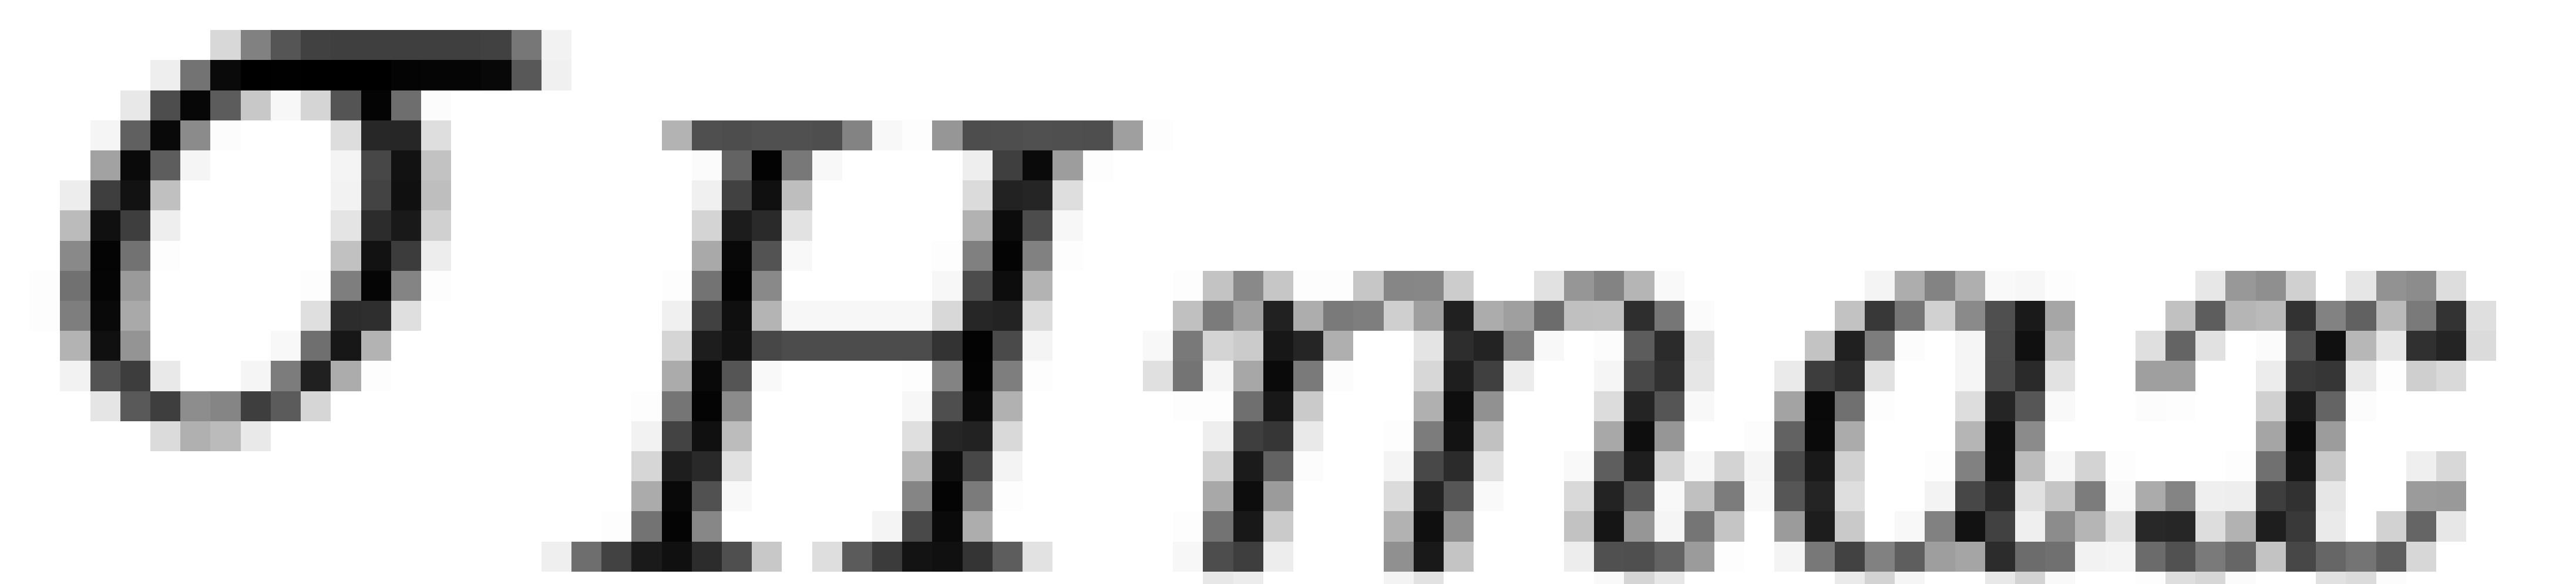

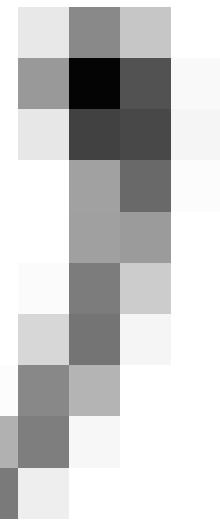

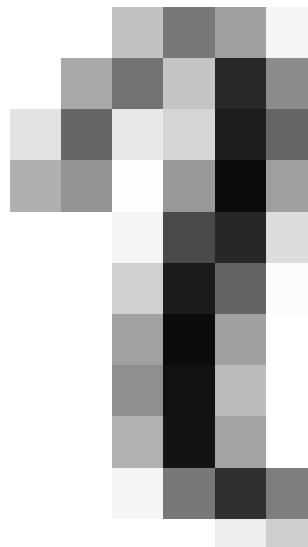

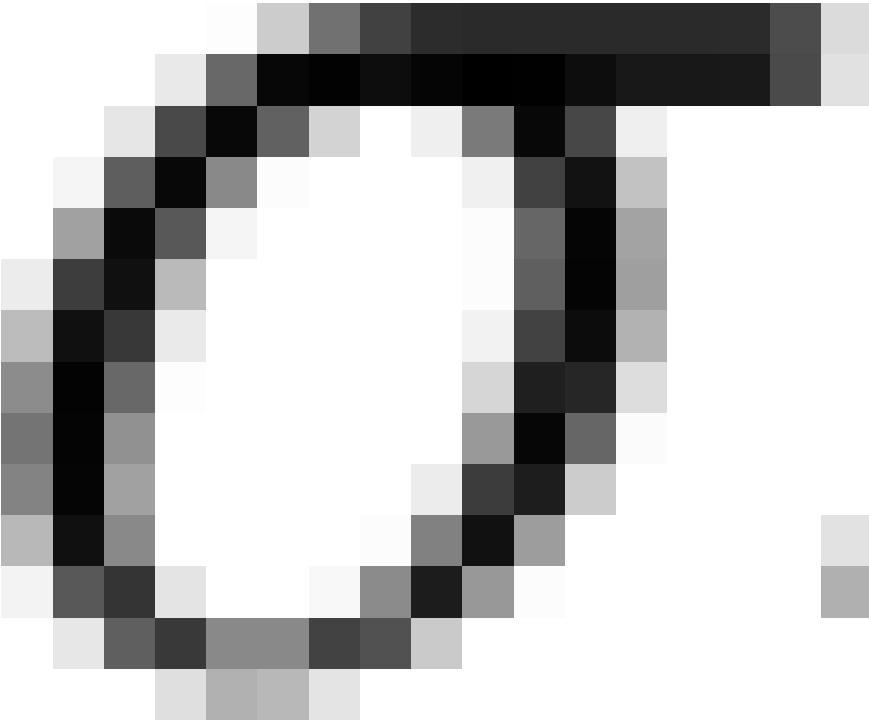

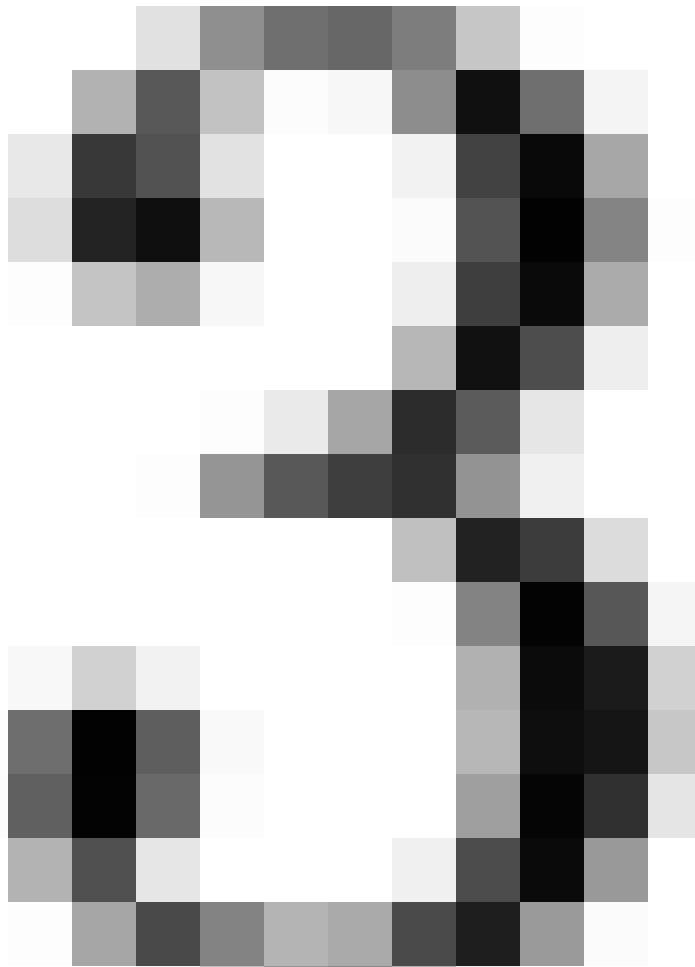

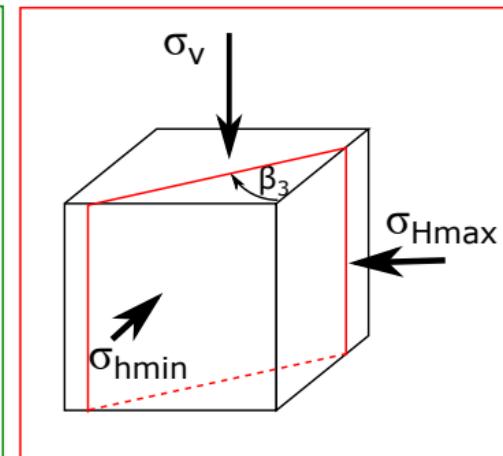

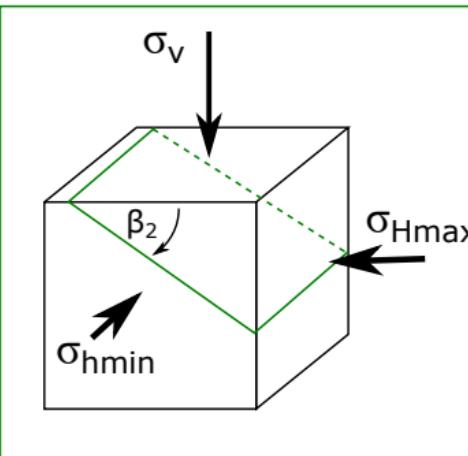

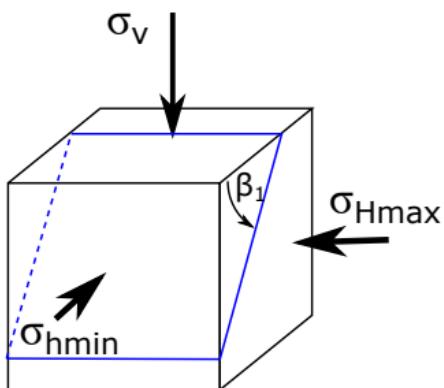

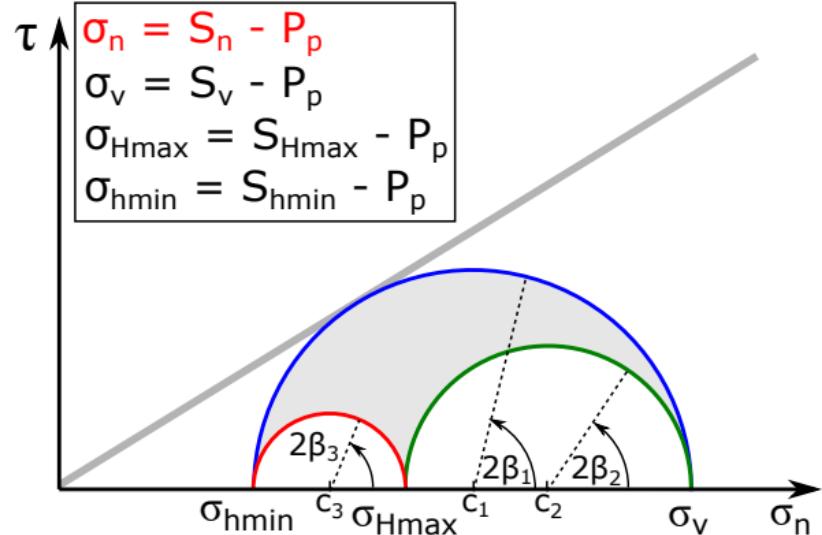

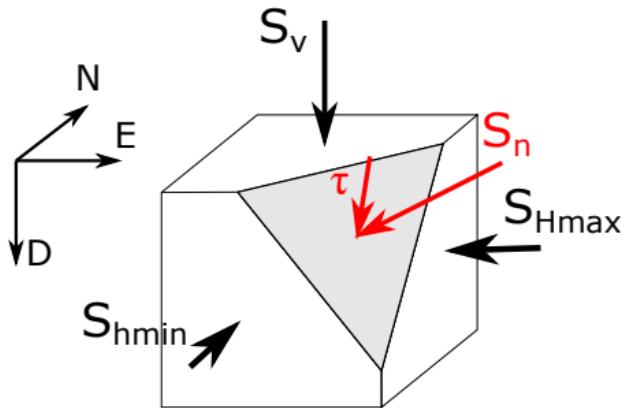

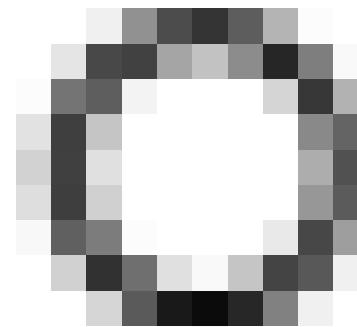

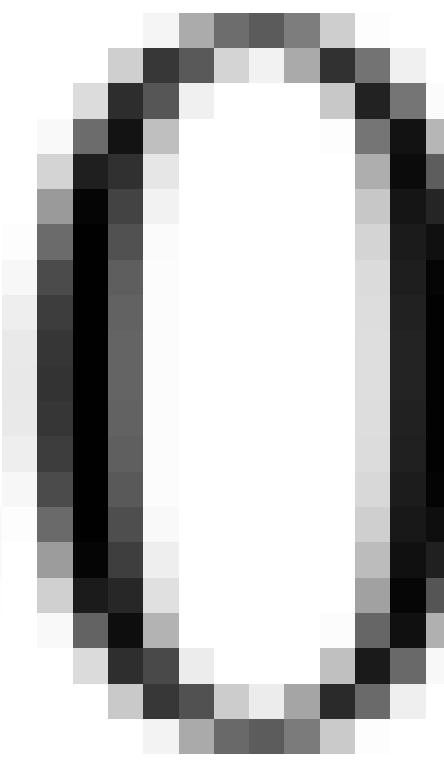

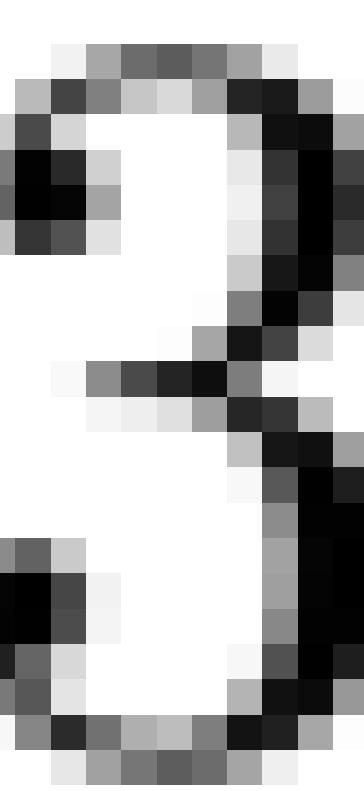

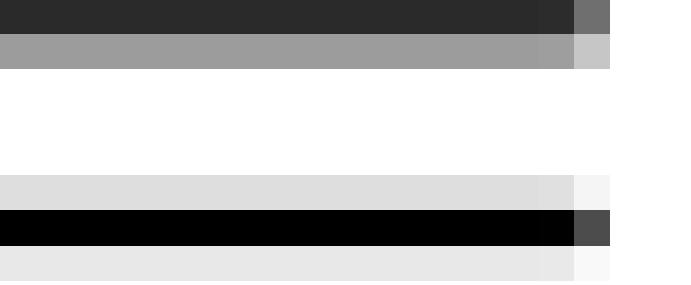

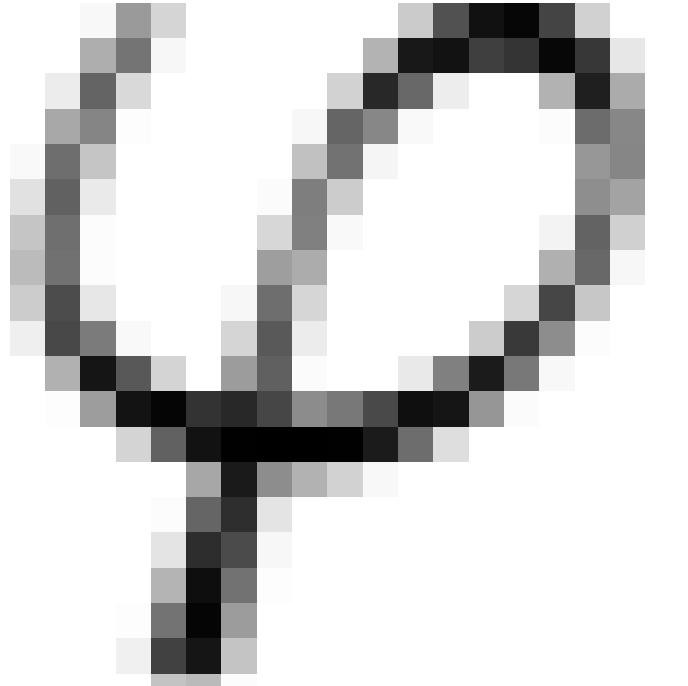

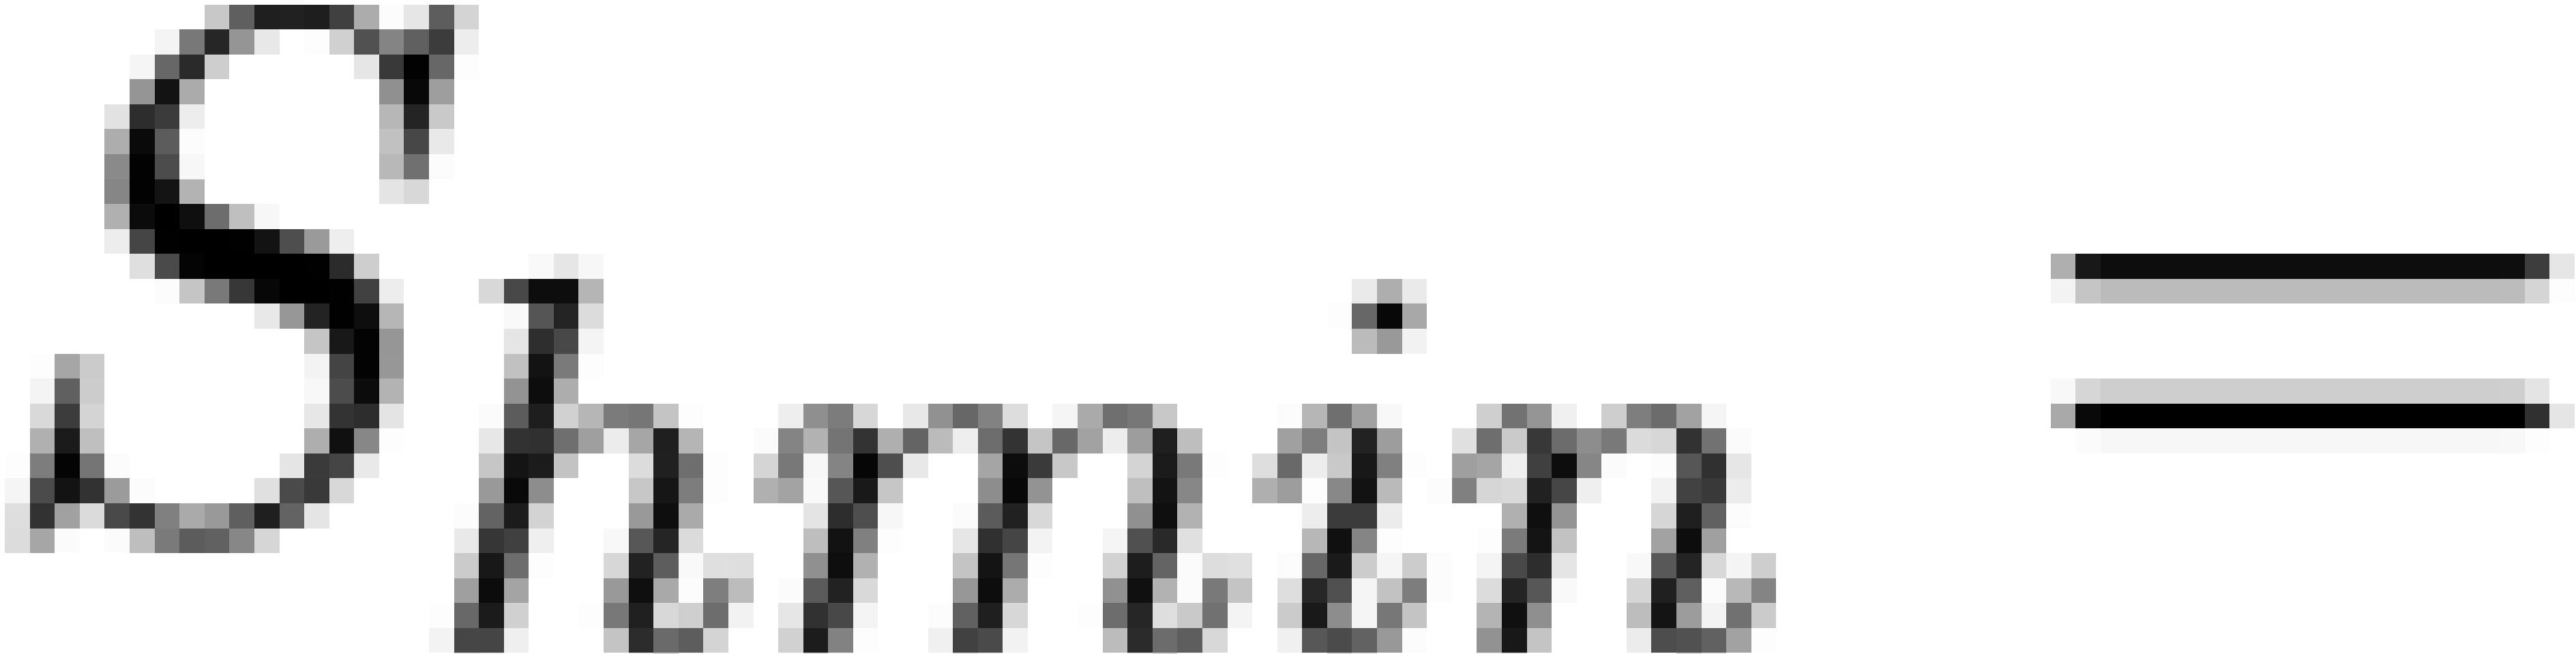

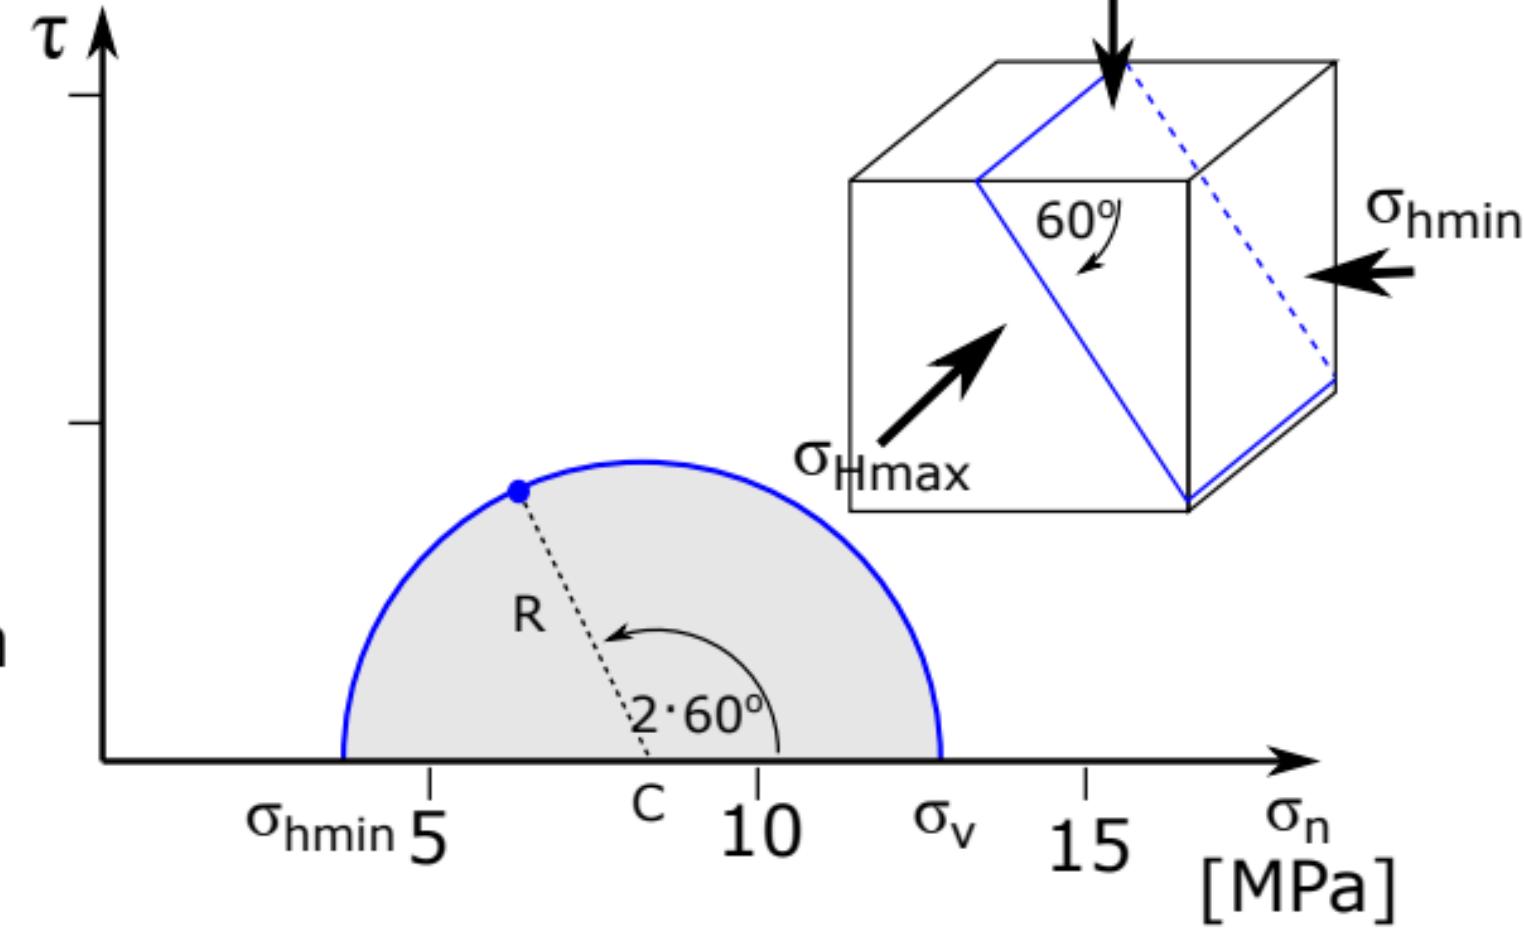

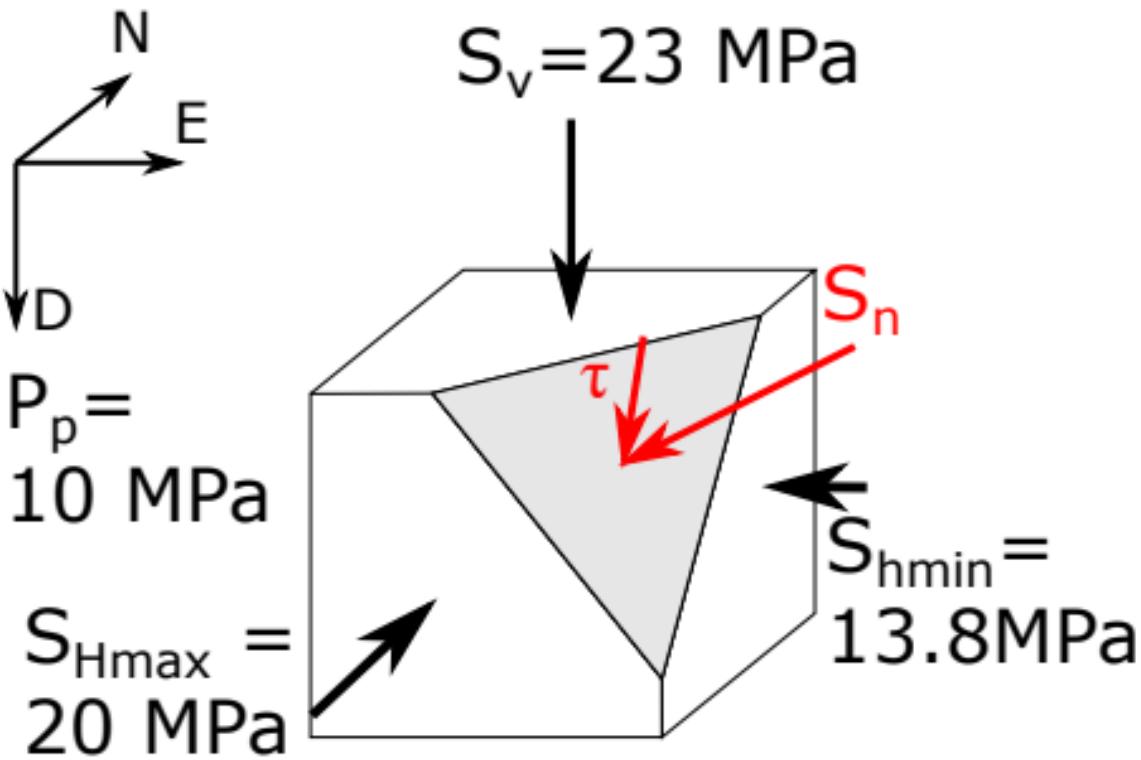

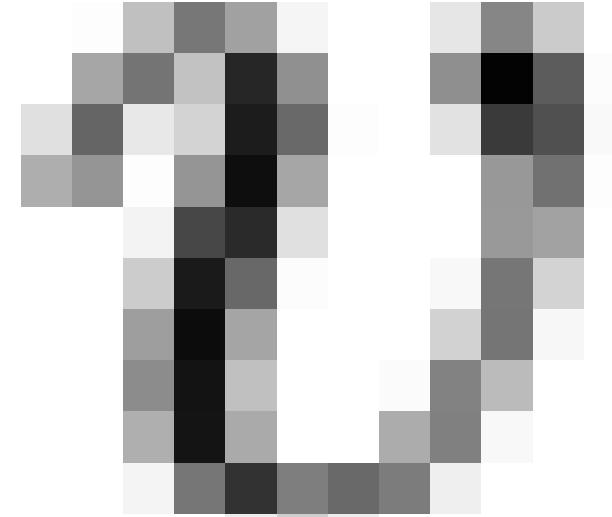

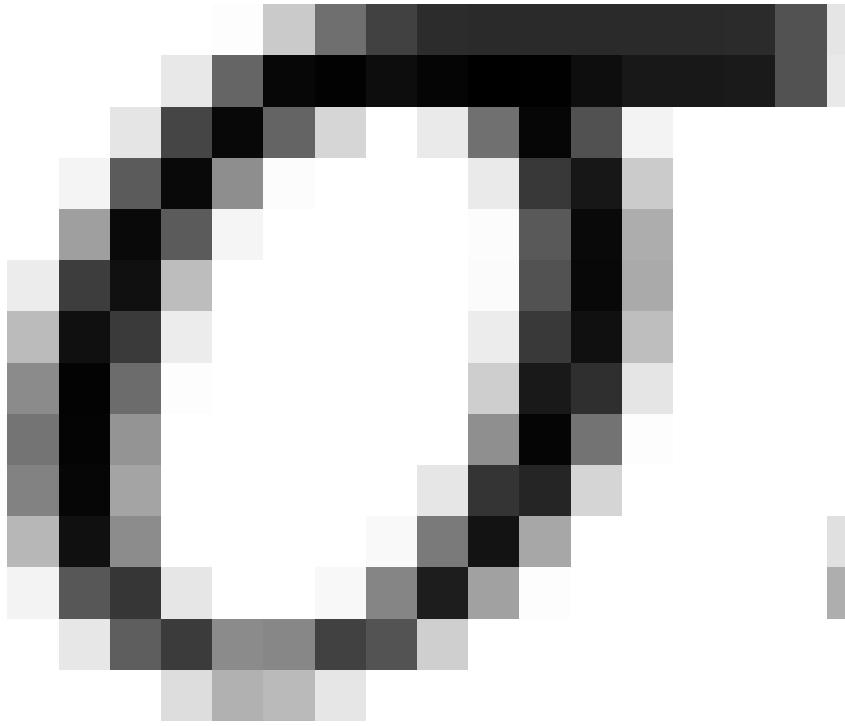

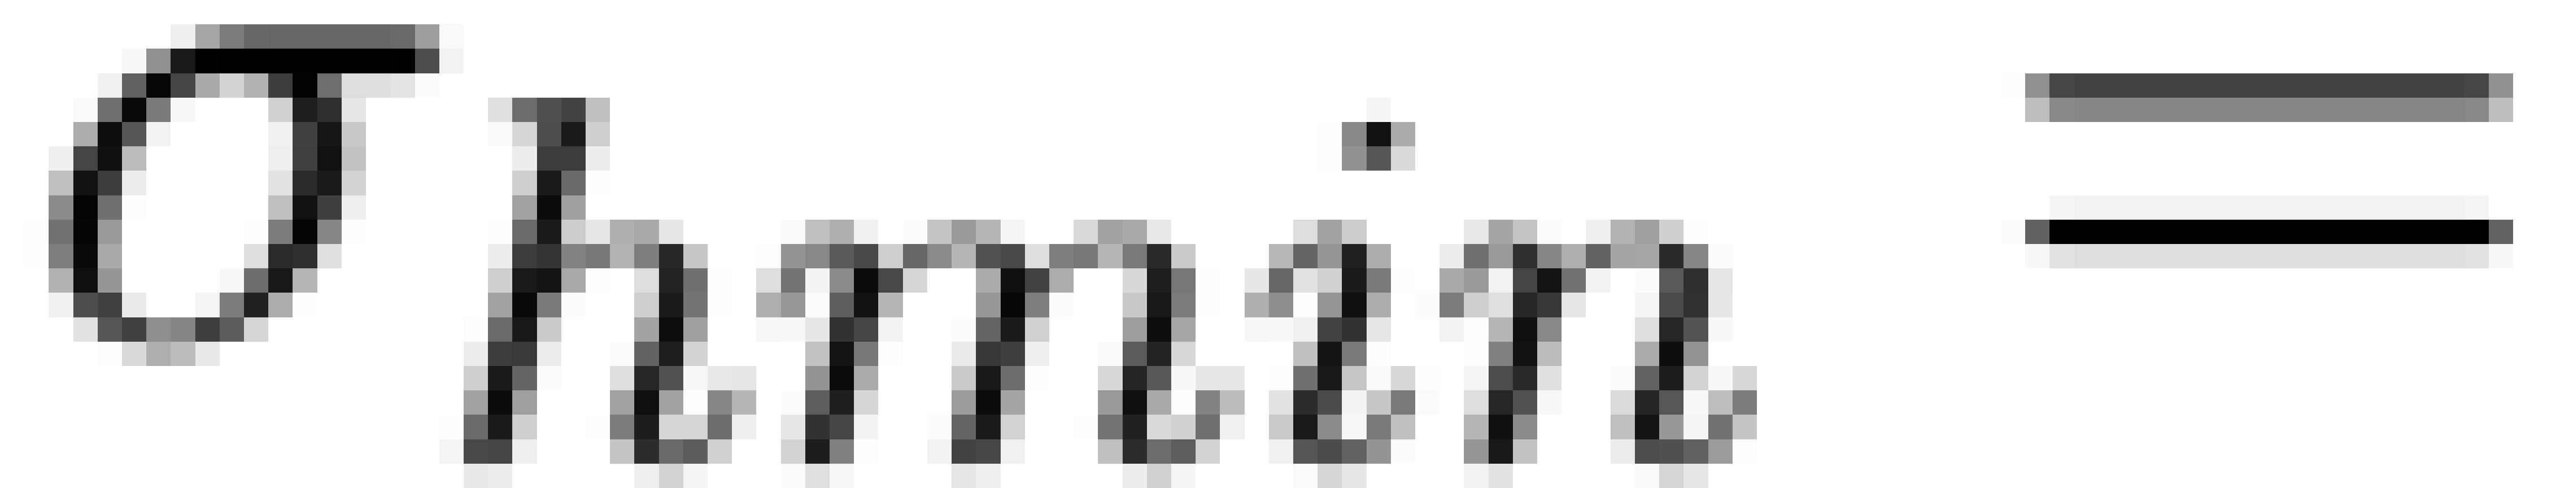

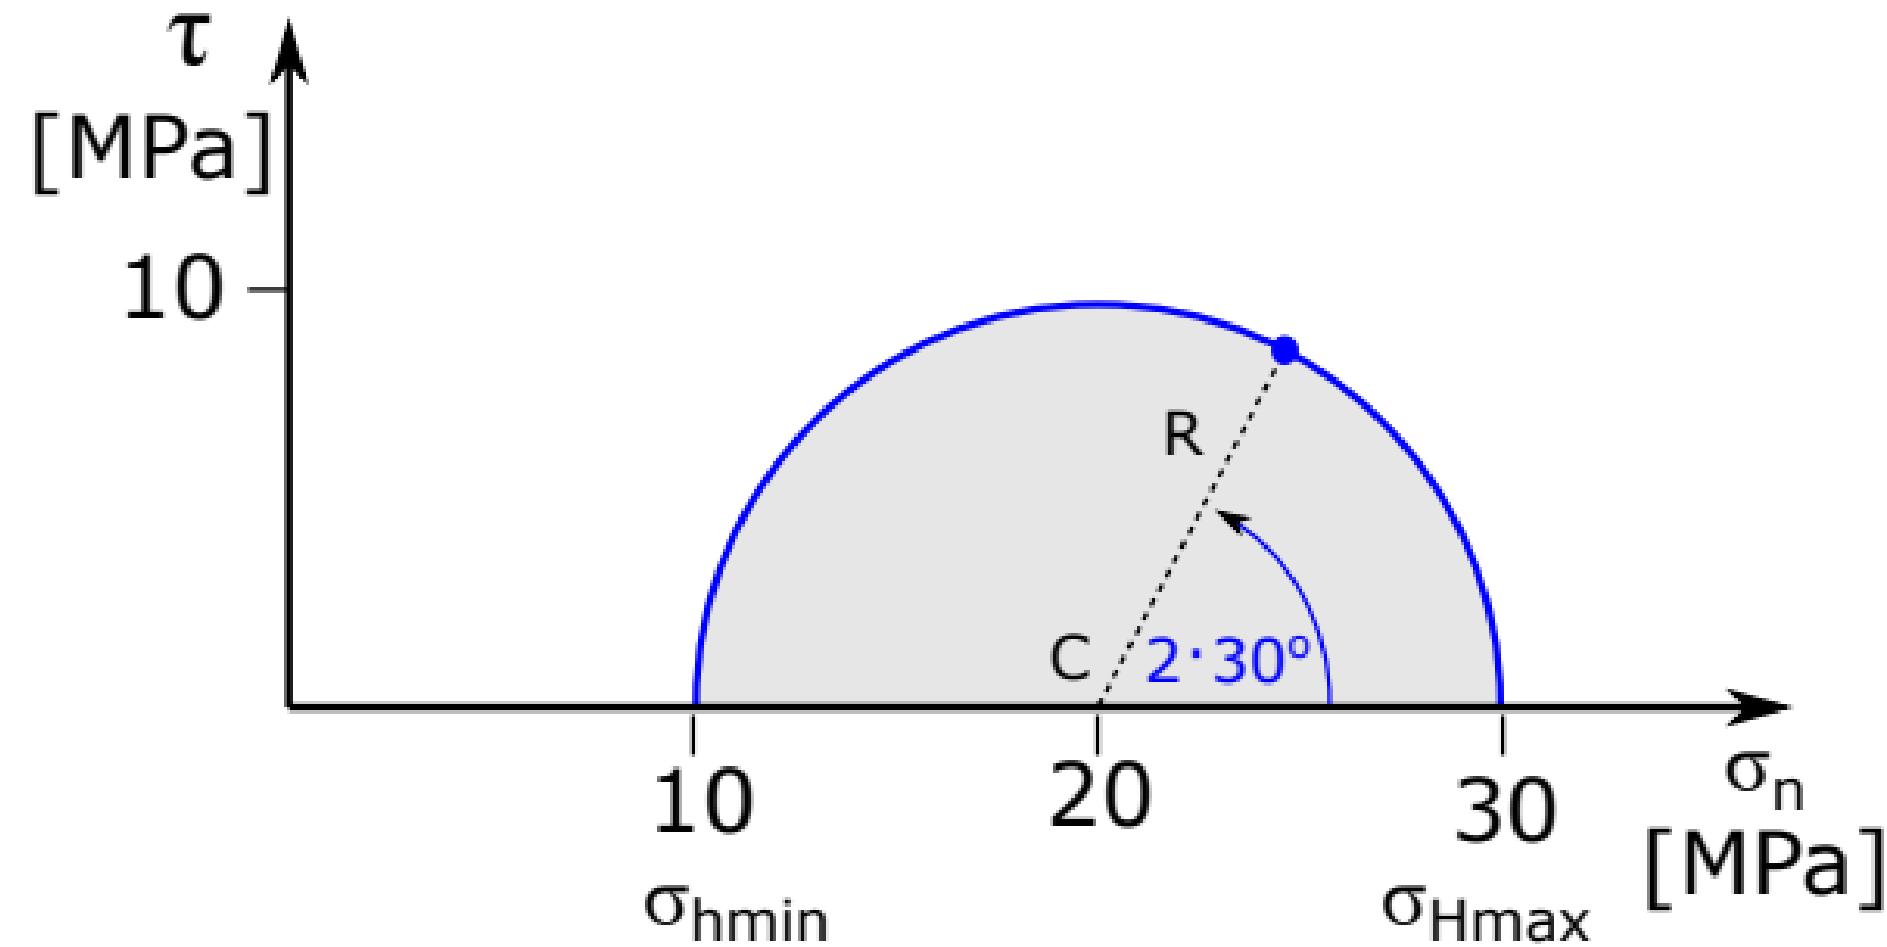

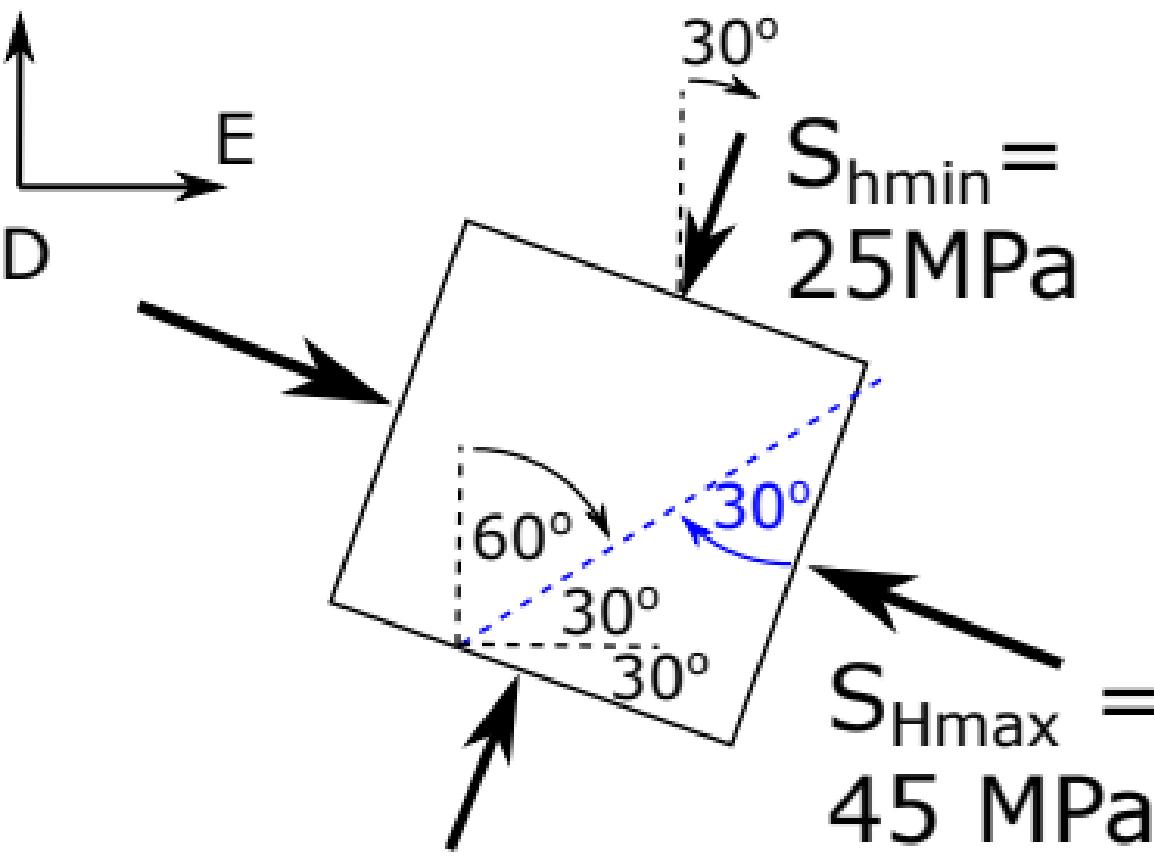

$$\sigma_n = \frac{(13 \text{ MPa} + 3.8 \text{ MPa})}{2} + \frac{(13 \text{ MPa} - 3.8 \text{ MPa}) \cos(2 \cdot 60^\circ)}{2} = 6.1 \text{ MPa}$$

$$\tau = \frac{(13 \text{ MPa} - 3.8 \text{ MPa})}{2} \sin(2 \cdot 60^\circ) = 4.0 \text{ MPa}$$

N $P_p = 15 \text{ MPa}$ $S_v = 30 \text{ MPa}$

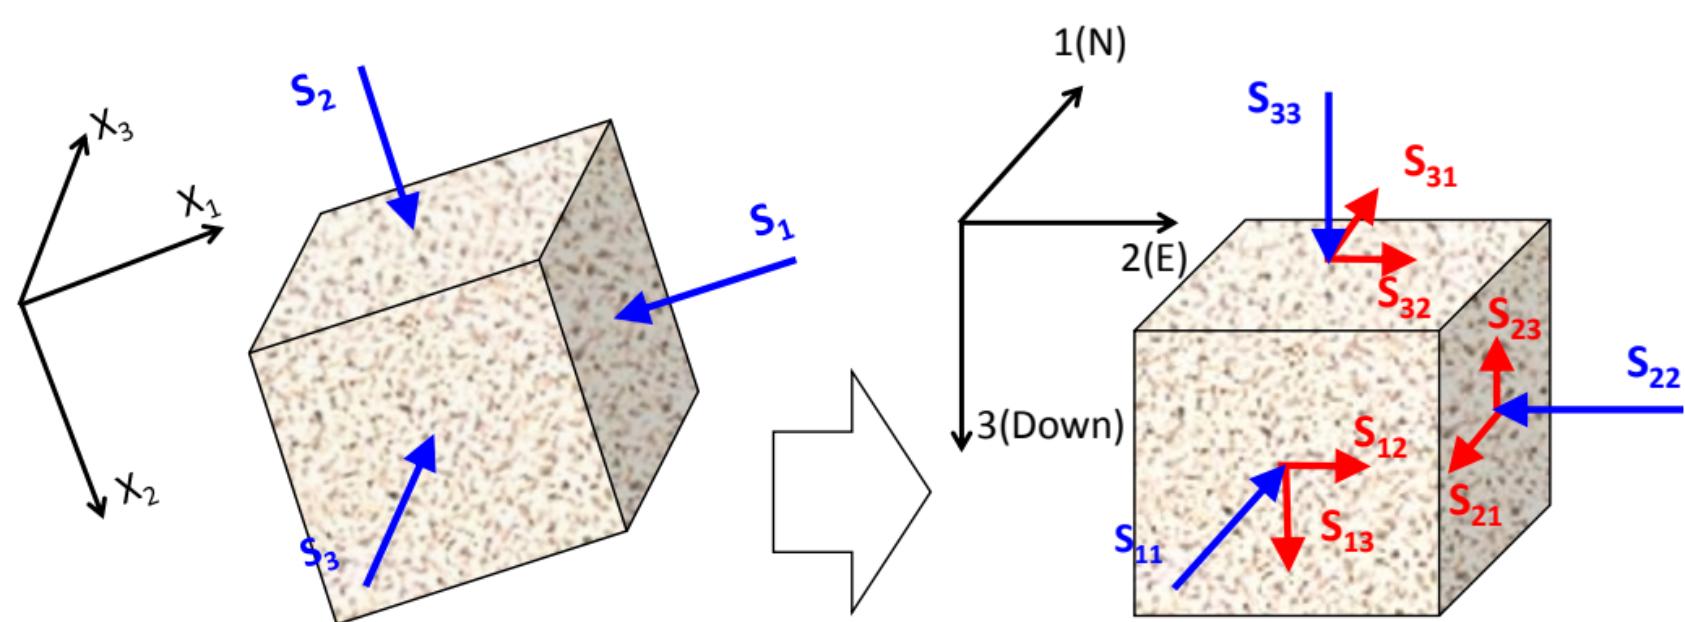

$$\sigma_n = \frac{(30 \text{ MPa} + 10 \text{ MPa})}{2} + \frac{(30 \text{ MPa} - 10 \text{ MPa}) \cos(2 \cdot 30^\circ)}{2} = 25 \text{ MPa}$$

$$\tau = \frac{(30 \text{ MPa} - 10 \text{ MPa})}{2} \sin(2 \cdot 30^\circ) = 8.7 \text{ MPa}$$

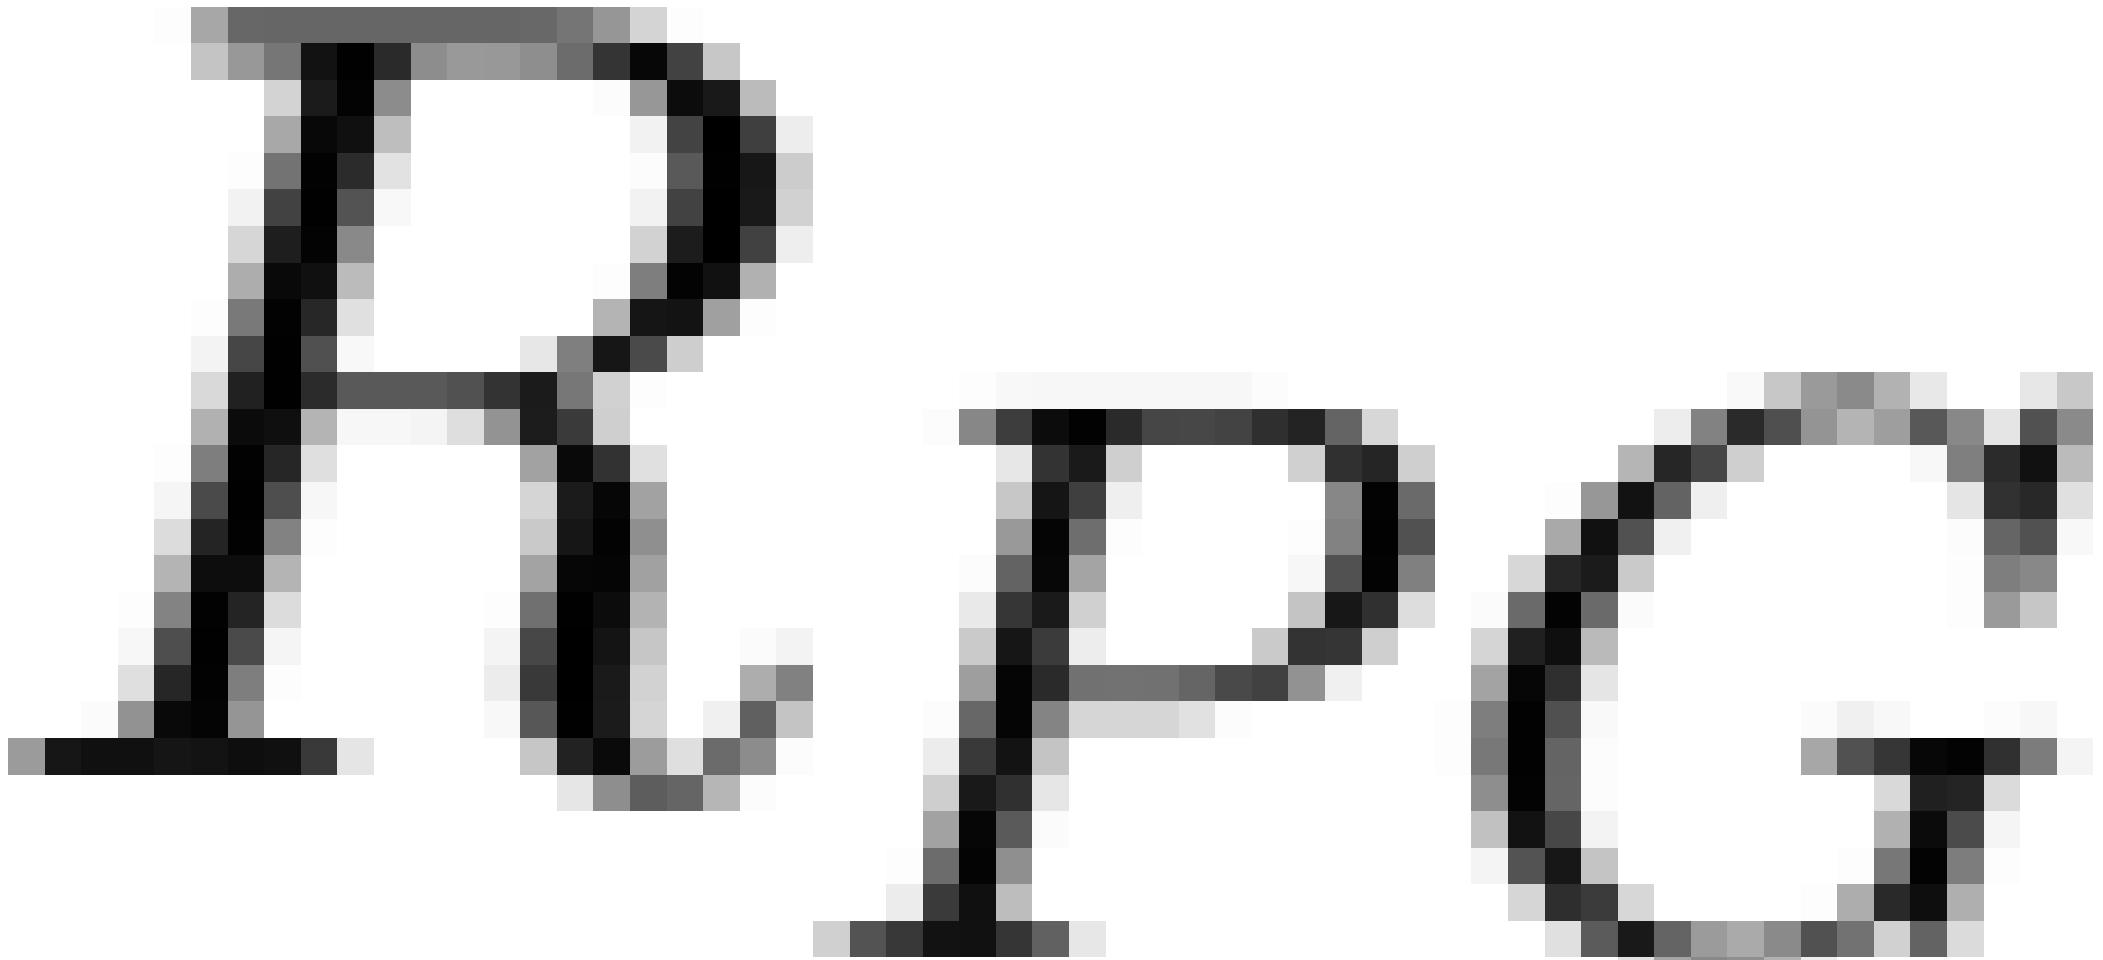

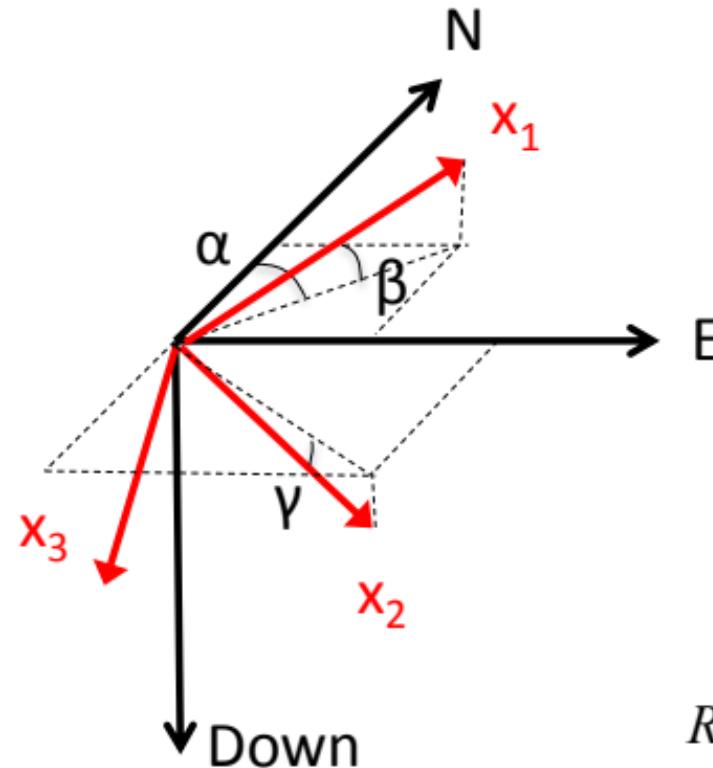

$$S_D = \begin{bmatrix} S_1 & 0 & 0 \\ 0 & S_2 & 0 \\ 0 & 0 & S_3 \end{bmatrix}$$

$$S_H = \begin{bmatrix} S_{11} & S_{12} & S_{13} \\ S_{21} & S_{22} & S_{23} \\ S_{31} & S_{32} & S_{33} \end{bmatrix}$$

$$E' = E / (1 - v^2)$$

Boundary conditions

$$\begin{cases} \sigma_{yy}(x,0) = -p(x) & \text{for } 0 \leq x \leq c \\ u_y(x,0) = 0 & \text{for } x > c \end{cases}$$

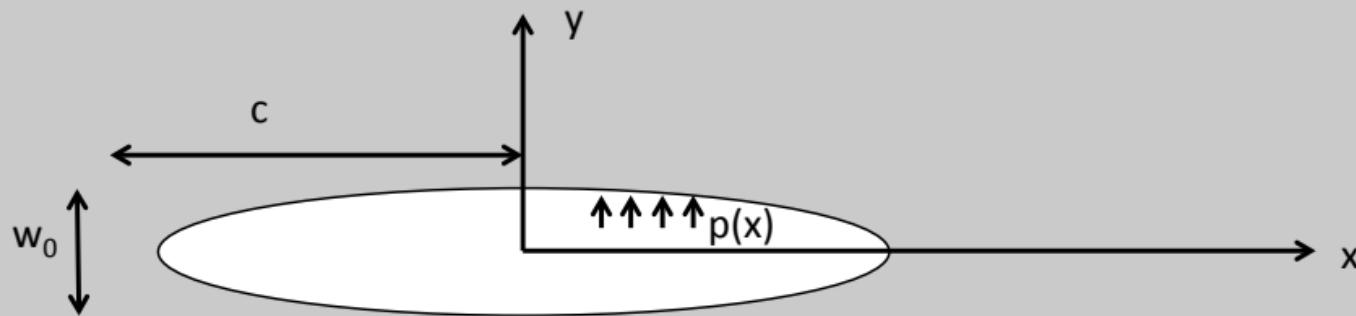

- Linear elastic and homogeneous solid
- Constant pressure p_0
- No failure

$$\begin{cases} \sigma_{yy}(x,0) = p_0[x/(x^2-c^2)^{1/2} - 1] \\ u_y(x,0) = 2p_0/E' * (c^2-x^2)^{1/2} \end{cases}$$

- σ_{yy} : tension for $x > c$; $\sigma_{yy} = -p_0$ at $1.15c$
- $w_0 = 4 \cdot c \cdot p_0 / E'$

Griffith crack problem

$$(E, v)$$
$$E' = E / (1 - v^2)$$

$$\sigma_{yy}(x,0) = p_0 [x/(x^2 - c^2)^{1/2} - 1]$$

- $\sigma_{yy} \rightarrow \infty$ at $x=c$!

A more convenient amount to compare is
the stress intensity factor

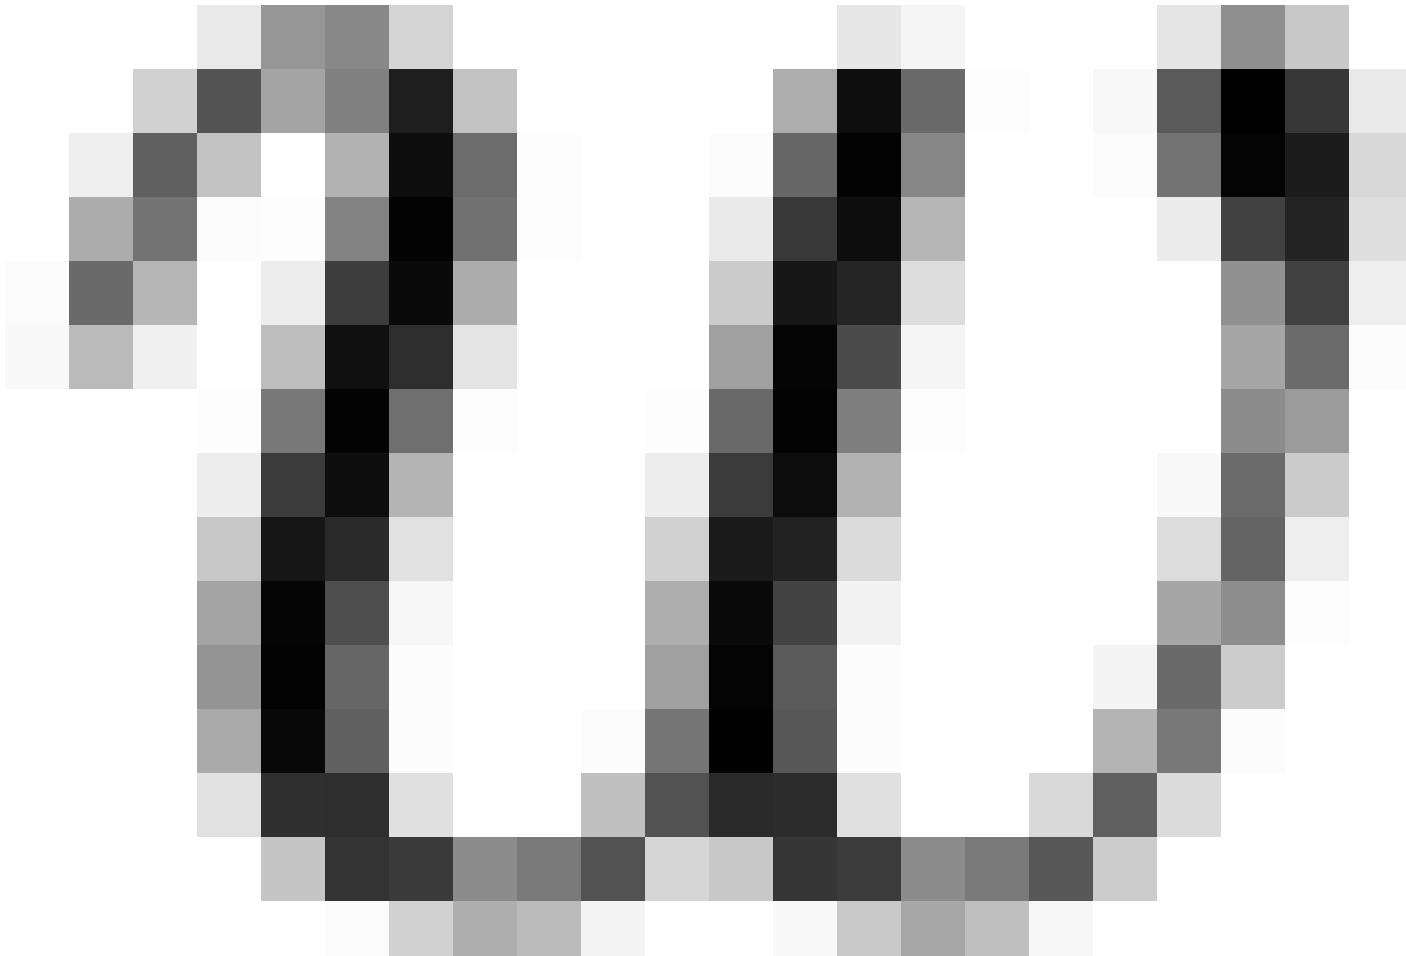

$$K_I = \lim_{r \rightarrow 0^+} \left[2\pi r^{1/2} \sigma_{yy}(x = c + r, y = 0) \right]$$

Constant pressure crack:

$$K_I = p_0 (\pi c)^{1/2}$$

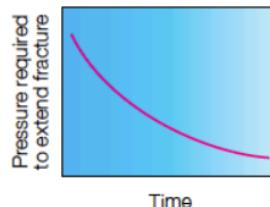

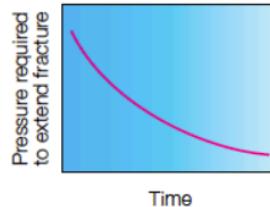

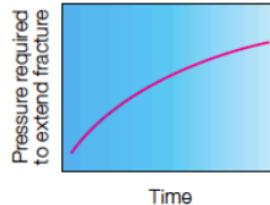

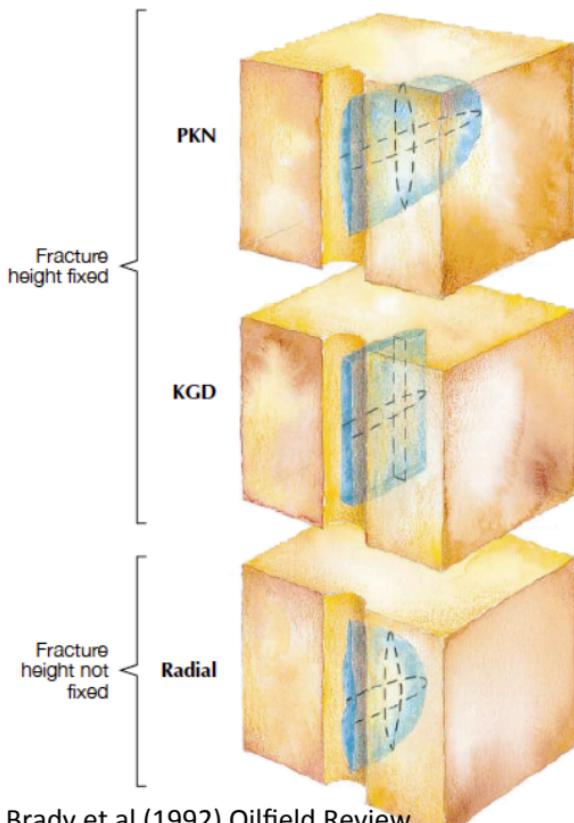

If $K_I > K_{IC}$ (Fracture Toughness)
→ Fracture propagates

2D Fracture Models

- Elliptical cross section
- Width \propto height
- Width < KGD; length > KGD
- More appropriate when fracture length > height

- Rectangular cross section
- Width \propto length
- More appropriate when fracture length < height

- Appropriate when fracture length = height

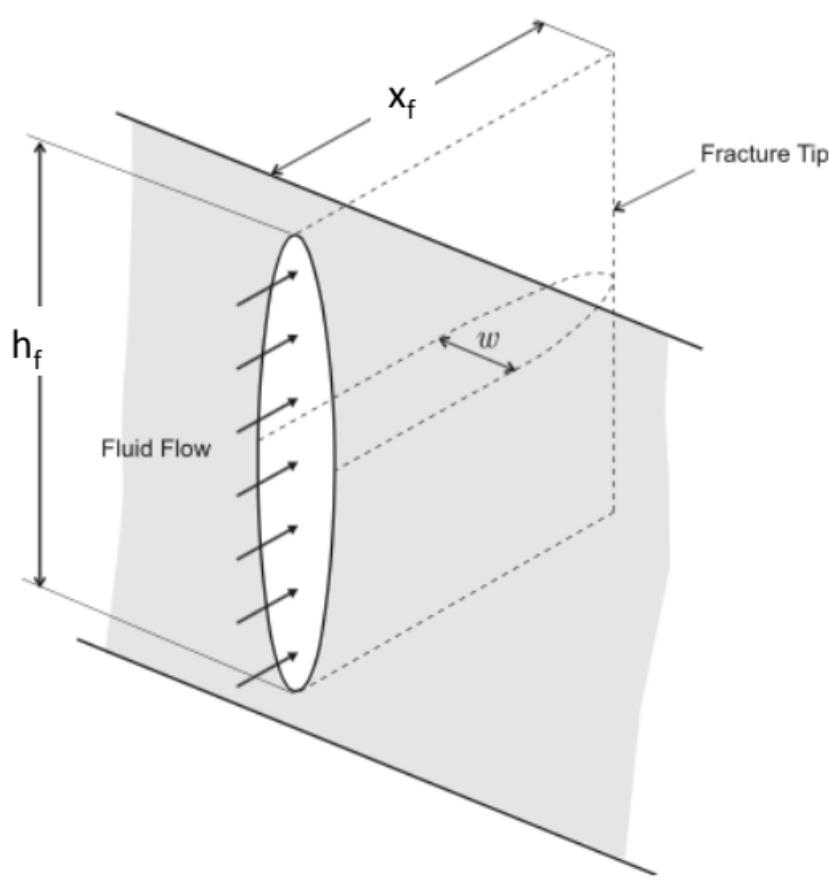

Fig. 1. Schematic showing PKN fracture geometry.

Figure: Adachi et al. 2007

- (1) Linear elasticity
- (2) Negligible Toughness
- (3) No leak-off
- (4) Laminar flow, constant injection rate

- Fracture half-length

$$x_f = 0.524 \left(\frac{i^3 E'}{\mu h_f^4} \right)^{1/5} (t)^{4/5}$$

- Maximum width at the wellbore

$$w_{w,0} = 3.04 \left(\frac{i^2 \mu}{E' h_f} \right)^{1/5} (t)^{1/5}$$

- Net Pressure at the wellbore

$$p_{n,w} = 1.52 \left(\frac{E'^4 i^2 \mu}{h_f^6} \right)^{1/5} (t)^{1/5}$$

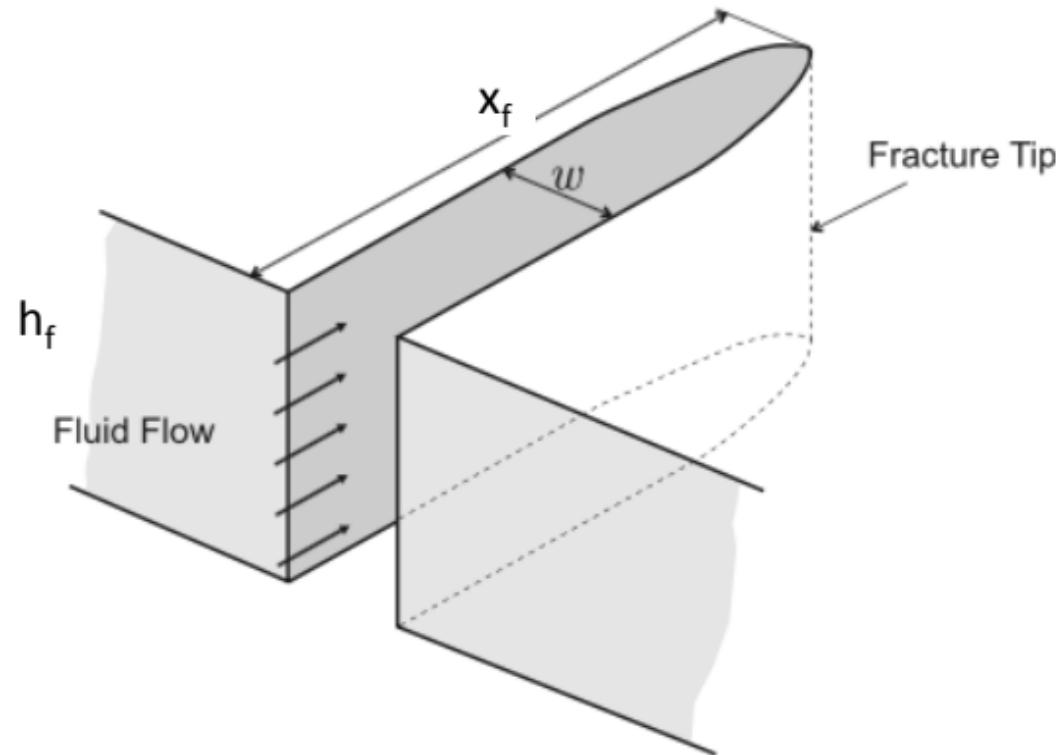

Fig. 2. Schematic showing KGD fracture geometry.

Figure: Adachi et al. 2007

- Fracture half-length

$$x_f = 0.539 \left(\frac{i^3 E'}{\mu h_f^3} \right)^{1/5} (t)^{2/3}$$

- Width at the wellbore

$$w_w = 2.36 \left(\frac{i^3 \mu}{E' h_f^3} \right)^{1/6} (t)^{1/3}$$

- Net Pressure at the wellbore

$$p_{n,w} = 1.09 (E'^2 \mu)^{1/3} (t)^{-1/3}$$
